SONiX 8-Bit Micro-Controller

SONiX reserves the right to make change without further notice to any products herein to improve reliability, function or design. SONiX does not assume any liability arising out of the application or use of any product or circuit described herein; neither does it convey any license under its patent rights nor the rights of others. SONiX products are not designed, intended, or authorized for use as components in systems intended, for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SONiX product could create a situation where personal injury or death may occur. Should Buyer purchase or use SONiX products for any such unintended or unauthorized application. Buyer shall indemnify and hold SONiX and its officers, employees, subsidiaries, affiliates and distributors harmless against all claims, cost, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use even if such claim alleges that SONiX was negligent regarding the design or manufacture of the part.

AMENDENT HISTORY

Version	Date	Description
VER1.0	2009/3/14	version 1.0
VER1.1	2009/5/11	1. Modify wakeup time's description. 2. Modify SIO rate setting.
VER1.2	2011/07/22	1. Add Rst_Length description in code option.

1 PRODUCT OVERVIEW

1.1 FEATURES

- ◆ **Memory configuration**
Flash ROM size: 10K x 16 bits, including in system programming function.
20000 erase/write cycles.
RAM size: 512 x 8 bits.
- ◆ **8 levels stack buffer**
- ◆ **I/O pin configuration**
Bi-directional: P0, P1, P2, P5
Wake-up: P0/P1 level change.
Pull-up resistors: P0, P1, P2, P5.
External interrupt: P0.0, P0.1 controlled by PEDGE.
- ◆ **Full Speed USB 2.0**
Conforms to USB specification, Version 2.0.

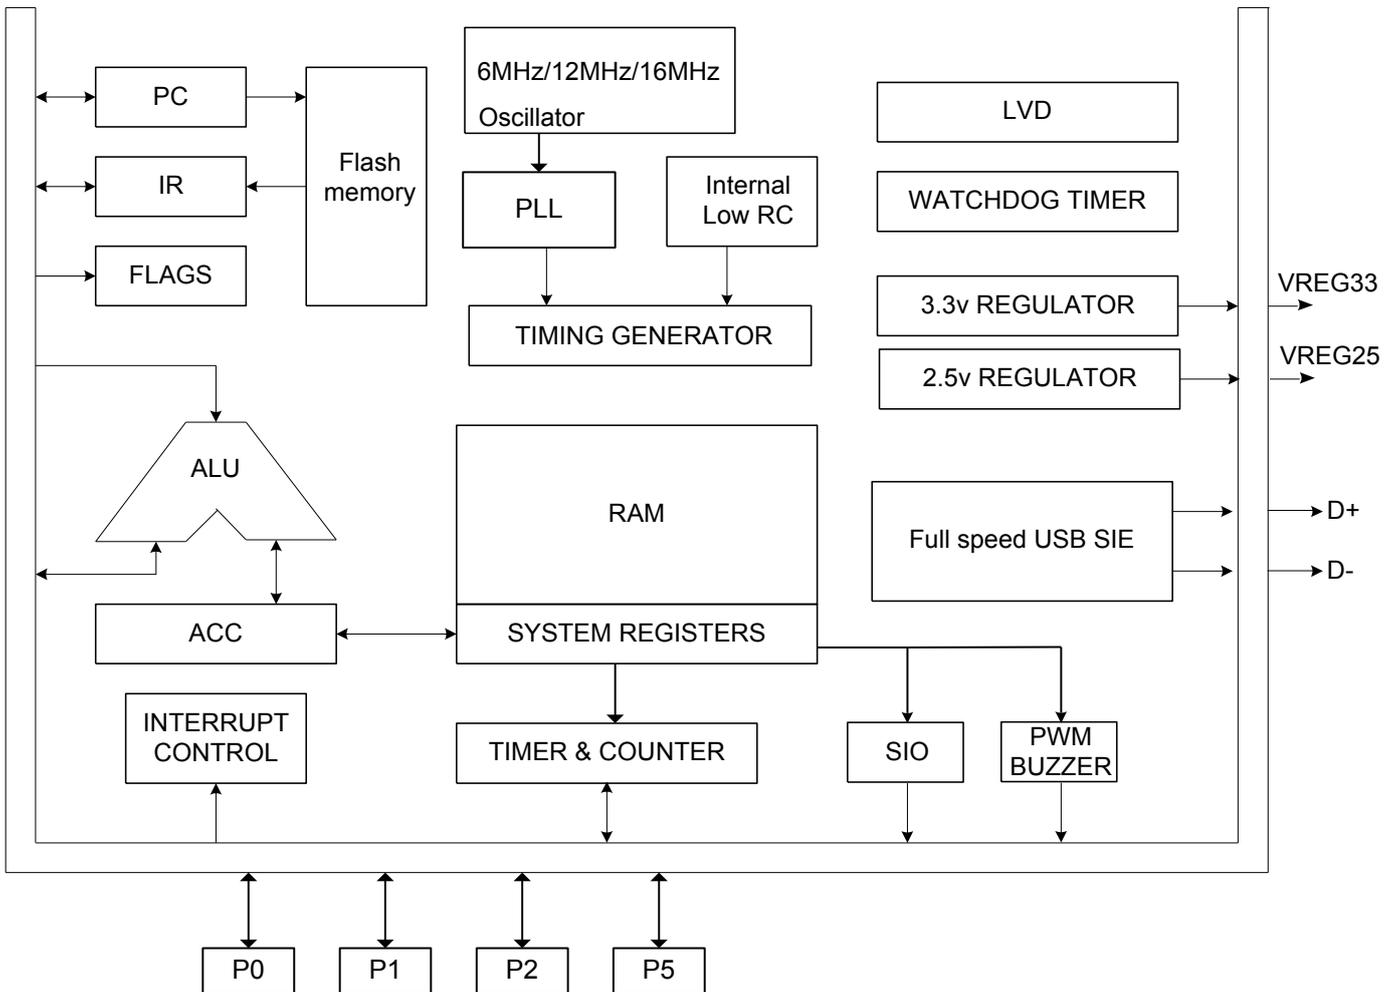

3.3V regulator output for USB D+ pin internal

1.5k ohm pull-up resistor.
Integrated USB transceiver.
Supports 1 Full speed USB device address,
1 control endpoint
3 interrupt IN/OUT endpoints, each has 16 bytes FIFO
- ◆ **Powerful instructions**
One clocks per instruction cycle (1T)
Most of instructions are one cycle only.
All ROM area JMP instruction.
All ROM area CALL address instruction.
All ROM area lookup table function (MOVC)
- ◆ **9 interrupt sources.**
Seven internal interrupts: T0, T1, TC0, TC1, USB, SIO, Wakeup
Two external interrupt: INT0, INT1.
- ◆ **One SIO function for data transfer (Serial Peripheral Interface)**
- ◆ **One 16-bit timer counters. (T1)**
- ◆ **Three 8 bits timer counter (T0, TC0, TC1)**
TC0, TC1. Each has 8 bit PWM function (duty/cycle programmable).
- ◆ **Two system clocks.**
Internal low clock: RC type 24KHz which Fosc = 24KHz.
External X'tal: 6MHz/12MHz/16MHz X'tal which the Fosc will be 12MHz.
- ◆ **Four operating modes.**
Normal mode: Both high and low clocks active.
Slow mode: Low clock only.
Sleep: Both high and low clocks stop.
Green mode: Periodical wakeup by timer.
- ◆ **Package**
QFN16, SSOP16, SOP20, SSOP20, SOP24, QFN24, LQFP32
- ◆ **On chip watchdog timer.**
- ◆ **In-system re-programmability**
Allows easy firmware update

☞ Features Selection Table

SN8F22531BJ (QFN 24 pins)

SN8F2255BF (LQFP 32 pins)

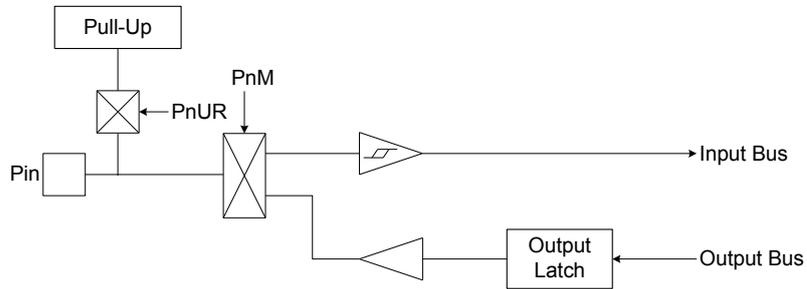

1.4 PIN DESCRIPTIONS

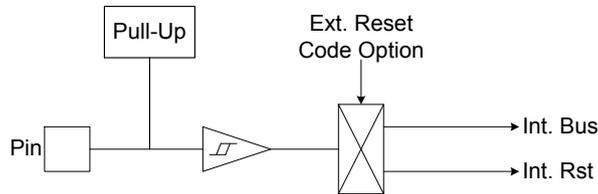

<i>PIN NAME</i>	<i>TYPE</i>	<i>DESCRIPTION</i>
VDD, VSS	P	Power supply input pins for digital circuit.
P0.0/INT0	I/O	P0.0: Port 0.0 bi-direction pin. Schmitt trigger structure and built-in pull-up resistors as input mode. Built wakeup function. INT0: External interrupt 0 input pin.
P0.1/INT1	I/O	P0.1: Port 0.1 bi-direction pin. Schmitt trigger structure and built-in pull-up resistors as input mode. Built wakeup function. INT1: External interrupt 1 input pin.
P0[3:2]	I/O	P0: Port 0 bi-direction pin. Schmitt trigger structure and built-in pull-up resistors as input mode. Built wakeup function.
P0.4/RST	I	RST is system external reset input pin under Ext_RST mode, Schmitt trigger structure, active "low", and normal stay to "high". P0.4 is input only pin with pull-up resistor under P0.4 mode. Built wakeup function.
P1[7:0]	I/O	P1: Port 1 bi-direction pin. Schmitt trigger structure and built-in pull-up resistors as input mode. Built wakeup function.
P2[5:0]	I/O	P2: Port 2 bi-direction pin. Schmitt trigger structure and built-in pull-up resistors as input mode.
P5.0/SCK	I/O	P5.0: Port 5.0 bi-direction pin. Schmitt trigger structure and built-in pull-up resistors as input mode. SCK: SIO output clock pin.
P5.1 /SDI	I/O	P5.1: Port 5.1 bi-direction pin. Schmitt trigger structure and built-in pull-up resistors as input mode. SDI: SIO data input pin.
P5.2/SDO	I/O	P5.2: Port 5.2 bi-direction pin. Schmitt trigger structure and built-in pull-up resistors as input mode. SDO: SIO data output pin.
P5.3/PWM1	I/O	P5: Port 5 bi-direction pin. Schmitt trigger structure and built-in pull-up resistors as input mode. PWM1: PMW 1 output pin.
P5.4/PWM0	I/O	P5: Port 5 bi-direction pin. Schmitt trigger structure and built-in pull-up resistors as input mode. PWM0: PMW 0 output pin.
XOUT	I/O	XOUT: Oscillator output pin while external crystal enable.
XIN	I/O	XIN: Oscillator input pin while external oscillator enable (crystal and RC).
VREG25	P	2.5V power pin. Please connect 1uF capacitor to GND.
VREG33	P	3.3V power pin. Please connect XuF capacitor to GND. X=1~10.
D+, D-	I/O	USB differential data line.

1.5 PIN CIRCUIT DIAGRAMS

Port 0, 1, 2, 5 structures:

Port 0.4 structure:

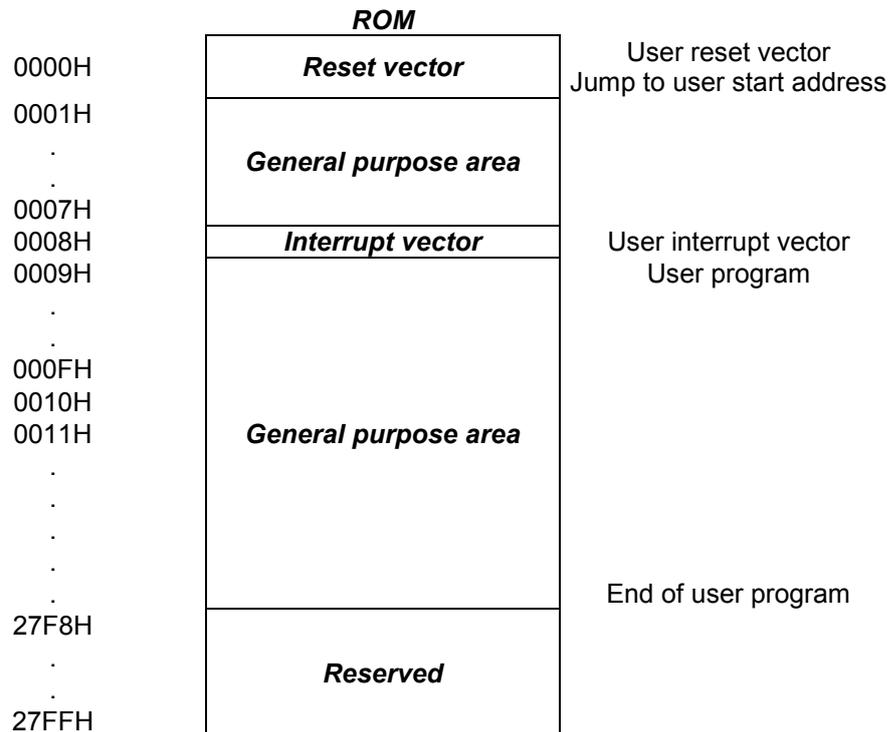

2 CENTRAL PROCESSOR UNIT (CPU)

2.1 MEMORY MAP

2.1.1 PROGRAM MEMORY (ROM)

☞ 10K words ROM

2.1.1.1 RESET VECTOR (0000H)

A one-word vector address area is used to execute system reset.

- ☞ **Power On Reset (NT0=1, NPD=0).**
- ☞ **Watchdog Reset (NT0=0, NPD=0).**
- ☞ **External Reset (NT0=1, NPD=1).**

After power on reset, external reset or watchdog timer overflow reset, then the chip will restart the program from address 0000h and all system registers will be set as default values. It is easy to know reset status from NT0, NPD flags of PFLAG register. The following example shows the way to define the reset vector in the program memory.

➤ **Example: Defining Reset Vector**

```

                ORG      0          ; 0000H
                JMP      START     ; Jump to user program address.
                ...

START:         ORG      10H        ; 0010H, The head of user program.
                ...              ; User program
                ...

                ENDP             ; End of program

```

2.1.1.2 INTERRUPT VECTOR (0008H)

A 1-word vector address area is used to execute interrupt request. If any interrupt service executes, the program counter (PC) value is stored in stack buffer and jump to 0008h of program memory to execute the vectored interrupt. Users have to define the interrupt vector. The following example shows the way to define the interrupt vector in the program memory.

* **Note: "PUSH", "POP" instructions save and load ACC/PFLAG without (NT0, NPD). PUSH/POP buffer is a unique buffer and only one level.**

➤ **Example: Defining Interrupt Vector. The interrupt service routine is following ORG 8.**

```
.CODE
    ORG      0          ; 0000H
    JMP     START      ; Jump to user program address.
    ...

    ORG      8          ; Interrupt vector.
    PUSH                     ; Save ACC and PFLAG register to buffers.
    ...
    POP                      ; Load ACC and PFLAG register from buffers.
    RETI                     ; End of interrupt service routine
    ...

START:
    ...              ; The head of user program.
    ...              ; User program
    JMP     START      ; End of user program
    ...

    ENDP                ; End of program
```

➤ **Example: Defining Interrupt Vector.** The interrupt service routine is following user program.

```
.CODE
    ORG    0          ; 0000H
    JMP    START      ; Jump to user program address.
    ...
    ORG    8          ; Interrupt vector.
    JMP    MY_IRQ     ; 0008H, Jump to interrupt service routine address.

START:
    ORG    10H        ; 0010H, The head of user program.
    ...              ; User program.
    ...
    JMP    START      ; End of user program.
    ...

MY_IRQ:
    ...              ; The head of interrupt service routine.
    PUSH   ACC        ; Save ACC and PFLAG register to buffers.
    ...
    ...
    POP    ACC        ; Load ACC and PFLAG register from buffers.
    RETI   RETI       ; End of interrupt service routine.
    ...

    ENDP             ; End of program.
```

* **Note:** It is easy to understand the rules of SONiX program from demo programs given above. These points are as following:

1. The address 0000H is a "JMP" instruction to make the program starts from the beginning.
2. The address 0008H is interrupt vector.
3. User's program is a loop routine for main purpose application.

2.1.1.3 LOOK-UP TABLE DESCRIPTION

In the ROM's data lookup function, Y register is pointed to middle byte address (bit 8~bit 15) and Z register is pointed to low byte address (bit 0~bit 7) of ROM. After MOVC instruction executed, the low-byte data will be stored in ACC and high-byte data stored in R register.

➤ **Example: To look up the ROM data located "TABLE1".**

```
B0MOV  Y, #TABLE1$M ; To set lookup table1's middle address
B0MOV  Z, #TABLE1$L ; To set lookup table1's low address.
MOVC   R, @Y        ; To lookup data, R = 00H, ACC = 35H
    ...
    INCMS Z          ; Increment the index address for next address.
    JMP   @F         ; Z+1
    INCMS Y          ; Z is not overflow.
    NOP             ; Z overflow (FFH → 00), → Y=Y+1
    ...
    ...

@@:    MOVC         ; To lookup data, R = 51H, ACC = 05H.
    ...
    ...

TABLE1: DW    0035H ; To define a word (16 bits) data.
        DW    5105H
        DW    2012H
    ...
```

* **Note:** The Y register will not increase automatically when Z register crosses boundary from 0xFF to 0x00. Therefore, user must take care such situation to avoid look-up table errors. If Z register is overflow, Y register must be added one. The following INC_YZ macro shows a simple method to process Y and Z registers automatically.

➤ **Example: INC_YZ macro.**

```
INC_YZ          MACRO
                 INCMS  Z          ; Z+1
                 JMP    @F         ; Not overflow

                 INCMS  Y          ; Y+1
                 NOP    @F         ; Not overflow
@@:
                 ENDM
```

➤ **Example: Modify above example by “INC_YZ” macro.**

```

        B0MOV    Y, #TABLE1$M    ; To set lookup table1's middle address
        B0MOV    Z, #TABLE1$L    ; To set lookup table1's low address.
        MOVC     ; To lookup data, R = 00H, ACC = 35H

        INC_YZ                ; Increment the index address for next address.
        ;
        ;
@@:     MOVC     ; To lookup data, R = 51H, ACC = 05H.
        ...
TABLE1: DW      0035H          ; To define a word (16 bits) data.
        DW      5105H
        DW      2012H
        ...

```

The other example of look-up table is to add Y or Z index register by accumulator. Please be careful if “carry” happen.

➤ **Example: Increase Y and Z register by B0ADD/ADD instruction.**

```

        B0MOV    Y, #TABLE1$M    ; To set lookup table's middle address.
        B0MOV    Z, #TABLE1$L    ; To set lookup table's low address.

        B0MOV    A, BUF        ; Z = Z + BUF.
        B0ADD    Z, A

        B0BTS1   FC            ; Check the carry flag.
        JMP      GETDATA      ; FC = 0
        INCMS    Y              ; FC = 1. Y+1.
        NOP

GETDATA: ;
        MOVC     ; To lookup data. If BUF = 0, data is 0x0035
        ; If BUF = 1, data is 0x5105
        ; If BUF = 2, data is 0x2012
        ...

TABLE1: DW      0035H          ; To define a word (16 bits) data.
        DW      5105H
        DW      2012H
        ...

```

2.1.1.4 JUMP TABLE DESCRIPTION

The jump table operation is one of multi-address jumping function. Add low-byte program counter (PCL) and ACC value to get one new PCL. If PCL is overflow after PCL+ACC, PCH adds one automatically. The new program counter (PC) points to a series jump instructions as a listing table. It is easy to make a multi-jump program depends on the value of the accumulator (A).

* **Note:** PCH only support PC up counting result and doesn't support PC down counting. When PCL is carry after PCL+ACC, PCH adds one automatically. If PCL borrow after PCL-ACC, PCH keeps value and not change.

➤ **Example: Jump table.**

```

ORG      0X0100      ; The jump table is from the head of the ROM boundary

B0ADD    PCL, A      ; PCL = PCL + ACC, PCH + 1 when PCL overflow occurs.
JMP      A0POINT    ; ACC = 0, jump to A0POINT
JMP      A1POINT    ; ACC = 1, jump to A1POINT
JMP      A2POINT    ; ACC = 2, jump to A2POINT
JMP      A3POINT    ; ACC = 3, jump to A3POINT

```

SONiX provides a macro for safe jump table function. This macro will check the ROM boundary and move the jump table to the right position automatically. The side effect of this macro maybe wastes some ROM size.

➤ **Example: If “jump table” crosses over ROM boundary will cause errors.**

```

@JMP_A    MACRO      VAL
IF        (($+1) !& 0XFF00) != (($+(VAL)) !& 0XFF00)
JMP      ($ | 0XFF)
ORG      ($ | 0XFF)
ENDIF
ADD      PCL, A
ENDM

```

* **Note:** “VAL” is the number of the jump table listing number.

➤ **Example: “@JMP_A” application in SONiX macro file called “MACRO3.H”.**

```

B0MOV    A, BUF0      ; “BUF0” is from 0 to 4.
@JMP_A   5            ; The number of the jump table listing is five.
JMP      A0POINT     ; ACC = 0, jump to A0POINT
JMP      A1POINT     ; ACC = 1, jump to A1POINT
JMP      A2POINT     ; ACC = 2, jump to A2POINT
JMP      A3POINT     ; ACC = 3, jump to A3POINT
JMP      A4POINT     ; ACC = 4, jump to A4POINT
    
```

If the jump table position is across a ROM boundary (0x00FF~0x0100), the “@JMP_A” macro will adjust the jump table routine begin from next RAM boundary (0x0100).

➤ **Example: “@JMP_A” operation.**

; Before compiling program.

ROM address	B0MOV	A, BUF0	; “BUF0” is from 0 to 4.
	@JMP_A	5	; The number of the jump table listing is five.
0X00FD	JMP	A0POINT	; ACC = 0, jump to A0POINT
0X00FE	JMP	A1POINT	; ACC = 1, jump to A1POINT
0X00FF	JMP	A2POINT	; ACC = 2, jump to A2POINT
0X0100	JMP	A3POINT	; ACC = 3, jump to A3POINT
0X0101	JMP	A4POINT	; ACC = 4, jump to A4POINT

; After compiling program.

ROM address	B0MOV	A, BUF0	; “BUF0” is from 0 to 4.
	@JMP_A	5	; The number of the jump table listing is five.
0X0100	JMP	A0POINT	; ACC = 0, jump to A0POINT
0X0101	JMP	A1POINT	; ACC = 1, jump to A1POINT
0X0102	JMP	A2POINT	; ACC = 2, jump to A2POINT
0X0103	JMP	A3POINT	; ACC = 3, jump to A3POINT
0X0104	JMP	A4POINT	; ACC = 4, jump to A4POINT

2.1.1.5 CHECKSUM CALCULATION

The last ROM addresses are reserved area. User should avoid these addresses (last address) when calculate the Checksum value.

➤ **Example: The demo program shows how to calculated Checksum from 00H to the end of user's code.**

```

MOV      A,#END_USER_CODE$L
B0MOV   END_ADDR1, A      ; Save low end address to end_addr1
MOV      A,#END_USER_CODE$M
B0MOV   END_ADDR2, A      ; Save middle end address to end_addr2
CLR      Y                ; Set Y to 00H
CLR      Z                ; Set Z to 00H

@@:
MOV      C
B0BSET  FC                ; Clear C flag
ADD      DATA1, A        ; Add A to Data1
MOV      A, R
ADC      DATA2, A        ; Add R to Data2
JMP      END_CHECK        ; Check if the YZ address = the end of code

AAA:
INCMS   Z                ; Z=Z+1
JMP     @B                ; If Z != 00H calculate to next address
JMP     Y_ADD_1          ; If Z = 00H increase Y

END_CHECK:
MOV      A, END_ADDR1
CMPS    A, Z              ; Check if Z = low end address
JMP     AAA              ; If Not jump to checksum calculate
MOV      A, END_ADDR2
CMPS    A, Y              ; If Yes, check if Y = middle end address
JMP     AAA              ; If Not jump to checksum calculate
JMP     CHECKSUM_END     ; If Yes checksum calculated is done.

Y_ADD_1:
INCMS   Y                ; Increase Y
NOP
JMP     @B                ; Jump to checksum calculate

CHECKSUM_END:
...
...
END_USER_CODE:          ; Label of program end

```

2.1.2 CODE OPTION TABLE

Code Option	Content	Function Description
Ext_OSC	6MHz	6MHz crystal /resonator for external oscillator.
	12MHz	12MHz crystal /resonator for external oscillator.
	16MHz	16MHz crystal /resonator for external oscillator.
Watch_Dog	Always_On	Watchdog timer is always on enable even in power down and green mode.
	Enable	Enable watchdog timer. Watchdog timer stops in power down mode and green mode.
	Disable	Disable Watchdog function.
Fcpu	Fhosc/1	Instruction cycle is 12 MHz clock.
	Fhosc/2	Instruction cycle is 6 MHz clock.
	Fhosc/4	Instruction cycle is 3 MHz clock.
Reset_Pin	Reset	Enable External reset pin.
	P04	Enable P0.4 input only, with pull-up resistor function.
Security0	Enable	Enable ROM code Security function.
	Disable	Disable ROM code Security function.
Security1	Enable	Enable ROM code Lock Address (0x2000~0x27FF) Security function.
	Disable	Disable ROM code Lock Address (0x2000~0x27FF) Security function.
Rst_Length	No	Disable External reset de-bounce time.
	128 * ILRC	Enable External reset de-bounce time.

* **Note: Fcpu code option is only available for High Clock. Fcpu of slow mode is Fhosc/4.**

2.1.3 DATA MEMORY (RAM)

2.1.4.2 SYSTEM REGISTER DESCRIPTION

R = Working register and ROM look-up data buffer.
PFLAG = ROM page and special flag register.
UDA = USB control register.
UDR0 = USB FIFO address pointer.
UDR0_W = USB FIFO write data buffer by UDP0 point to.
EP_ACK = Endpoint ACK flag register.
UToggle = USB endpoint toggle bit control register.
USTATUS = USB status register.
EPXOUT_CNT = USB endpoint 1~3 OUT token data byte counter
SIOM = SIO mode control register.
SIOB = SIO's data buffer.
PnM = Port n input/output mode register.
INTRQ = Interrupt request register.
INTRQ1 = Interrupt1 request register.
OSCM = Oscillator mode register.
TC0R = TC0 auto-reload data buffer.
Pn = Port n data buffer.
TnC = T0 counting register. n = 0, 1, C0, C1
PnUR = Port n pull-up resistor control register.
P1W = Port 1 wakeup control register.
PEROM = ISP ROM address.
PERAMCNT = ISP RAM programming counter register.

Y, Z = Working, @YZ and ROM addressing register.
RBANK = RAM bank selection register.
UE0R~UE3R = Endpoint 0~3 control registers.
UDR0_R = USB FIFO read data buffer by UDP0 point to.
EP_NAK = Endpoint NAK flag register.
UDR0_W = USB FIFO write data buffer by UDP1 point to.
UPID = USB bus control register.
USB_INT_EN = USB interrupt enable/disable control register.
SIOR = SIO's clock reload buffer
PEDGE = P0.0, P0.1 edge direction register.
INTEN = Interrupt enable register.
INTEN1 = Interrupt1 enable register.
WDTR = Watchdog timer clear register.
PCH, PCL = Program counter.
TnM = Tn mode register. n = 0, 1, C0, C1
TnR = Tn register. n = C0, C1
STKP = Stack pointer buffer.
@YZ = RAM YZ indirect addressing index pointer.
STK0~STK7 = Stack 0 ~ stack 7 buffer.
PECMD = ISP command register.
PERAM = ISP RAM mapping address.

0FFH			S0PC13	S0PC12	S0PC11	S0PC10	S0PC9	S0PC8	R/W	STK0H

*** Note:**

1. To avoid system error, please be sure to put all the "0" and "1" as it indicates in the above table.
2. All of register names had been declared in SN8ASM assembler.
3. One-bit name had been declared in SN8ASM assembler with "F" prefix code.
4. "b0bset", "b0bclr", "bset", "bclr" instructions are only available to the "R/W" registers.
5. For detail description, please refer to the "System Register Quick Reference Table".

2.1.4.4 ACCUMULATOR

The ACC is an 8-bit data register responsible for transferring or manipulating data between ALU and data memory. If the result of operating is zero (Z) or there is carry (C or DC) occurrence, then these flags will be set to PFLAG register. ACC is not in data memory (RAM), so ACC can't be access by "B0MOV" instruction during the instant addressing mode.

➤ **Example: Read and write ACC value.**

; Read ACC data and store in BUF data memory.

```
MOV     BUF, A
```

; Write a immediate data into ACC.

```
MOV     A, #0FH
```

; Write ACC data from BUF data memory.

```
MOV     A, BUF
```

; or

```
B0MOV   A, BUF
```

The system doesn't store ACC and PFLAG value when interrupt executed. ACC and PFLAG data must be saved to other data memories. "PUSH", "POP" save and load ACC, PFLAG data into buffers.

➤ **Example: Protect ACC and working registers.**

INT_SERVICE:

```
PUSH     ; Save ACC and PFLAG to buffers.
```

```
...
```

```
POP     ; Load ACC and PFLAG from buffers.
```

```
RETI    ; Exit interrupt service vector
```

2.1.4.5 PROGRAM FLAG

The PFLAG register contains the arithmetic status of ALU operation, system reset status and LVD detecting status. NT0, NPD bits indicate system reset status including power on reset, LVD reset, reset by external pin active and watchdog reset. C, DC, Z bits indicate the result status of ALU operation.

086H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PFLAG	NT0	NPD	-	-	-	C	DC	Z
Read/Write	R/W	R/W	-	-	-	R/W	R/W	R/W
After reset	-	-	-	-	-	0	0	0

Bit [7:6] **NT0, NPD:** Reset status flag.

NT0	NPD	Reset Status
0	0	Watch-dog time out
0	1	Reserved
1	0	Reset by LVD
1	1	Reset by external Reset Pin

Bit 2 **C:** Carry flag
 1 = Addition with carry, subtraction without borrowing, rotation with shifting out logic "1", comparison result ≥ 0 .
 0 = Addition without carry, subtraction with borrowing signal, rotation with shifting out logic "0", comparison result < 0 .

Bit 1 **DC:** Decimal carry flag
 1 = Addition with carry from low nibble, subtraction without borrow from high nibble.
 0 = Addition without carry from low nibble, subtraction with borrow from high nibble.

Bit 0 **Z:** Zero flag
 1 = The result of an arithmetic/logic/branch operation is zero.
 0 = The result of an arithmetic/logic/branch operation is not zero.

* **Note:** Refer to instruction set table for detailed information of C, DC and Z flags.

2.1.4.6 PROGRAM COUNTER

The program counter (PC) is a 14-bit binary counter separated into the high-byte 6 and the low-byte 8 bits. This counter is responsible for pointing a location in order to fetch an instruction for kernel circuit. Normally, the program counter is automatically incremented with each instruction during program execution.

Besides, it can be replaced with specific address by executing CALL or JMP instruction. When JMP or CALL instruction is executed, the destination address will be inserted to bit 0 ~ bit 13.

	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PC	-	-	PC13	PC12	PC11	PC10	PC9	PC8	PC7	PC6	PC5	PC4	PC3	PC2	PC1	PC0
After reset	-	-	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	PCH								PCL							

ONE ADDRESS SKIPPING

There are nine instructions (CMPRS, INCS, INCMS, DECS, DECMS, BTS0, BTS1, B0BTS0, B0BTS1) with one address skipping function. If the result of these instructions is true, the PC will add 2 steps to skip next instruction.

If the condition of bit test instruction is true, the PC will add 2 steps to skip next instruction.

```

                B0BTS1   FC           ; To skip, if Carry_flag = 1
                JMP      C0STEP      ; Else jump to C0STEP.
                ...
                ...
C0STEP:        NOP

                B0MOV    A, BUF0     ; Move BUF0 value to ACC.
                B0BTS0   FZ           ; To skip, if Zero flag = 0.
                JMP      C1STEP      ; Else jump to C1STEP.
                ...
                ...
C1STEP:        NOP
    
```

If the ACC is equal to the immediate data or memory, the PC will add 2 steps to skip next instruction.

```

                CMPRS    A, #12H     ; To skip, if ACC = 12H.
                JMP      C0STEP      ; Else jump to C0STEP.
                ...
                ...
C0STEP:        NOP
    
```

If the destination increased by 1, which results overflow of 0xFF to 0x00, the PC will add 2 steps to skip next instruction.

INCS instruction:

INCS BUF0
JMP C0STEP ; Jump to C0STEP if ACC is not zero.

...

...

C0STEP: NOP

INCMS instruction:

INCMS BUF0
JMP C0STEP ; Jump to C0STEP if BUF0 is not zero.

...

...

C0STEP: NOP

If the destination decreased by 1, which results underflow of 0x01 to 0x00, the PC will add 2 steps to skip next instruction.

DECS instruction:

DECS BUF0
JMP C0STEP ; Jump to C0STEP if ACC is not zero.

...

...

C0STEP: NOP

DECMS instruction:

DECMS BUF0
JMP C0STEP ; Jump to C0STEP if BUF0 is not zero.

...

...

C0STEP: NOP

☞ MULTI-ADDRESS JUMPING

Users can jump around the multi-address by either JMP instruction or ADD M, A instruction (M = PCL) to activate multi-address jumping function. Program counter can't carry to PCH when PCL overflow automatically after executing addition instructions. Users have to take care program counter result and adjust PCH value by program. For jump table or others applications, users have to calculate PC value to avoid PCL overflow making PC error and program executing error.

* **Note: Program counter can't carry to PCH when PCL overflow automatically after executing addition instructions. Users have to take care program counter result and adjust PCH value by program.**

➤ Example: If PC = 0323H (PCH = 03H, PCL = 23H)

```
; PC = 0323H
      MOV      A, #28H
      B0MOV   PCL, A          ; Jump to address 0328H
      ...

; PC = 0328H
      MOV      A, #00H
      B0MOV   PCL, A          ; Jump to address 0300H
      ...
```

➤ Example: If PC = 0323H (PCH = 03H, PCL = 23H)

```
; PC = 0323H
      B0ADD   PCL, A          ; PCL = PCL + ACC, the PCH cannot be changed.
      JMP     A0POINT        ; If ACC = 0, jump to A0POINT
      JMP     A1POINT        ; ACC = 1, jump to A1POINT
      JMP     A2POINT        ; ACC = 2, jump to A2POINT
      JMP     A3POINT        ; ACC = 3, jump to A3POINT
      ...
      ...
```

2.1.5 Y, Z REGISTERS

The Y and Z registers are the 8-bit buffers. There are three major functions of these registers.

- can be used as general working registers
- can be used as RAM data pointers with @YZ register
- can be used as ROM data pointer with the MOVC instruction for look-up table

084H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Y	YBIT7	YBIT6	YBIT5	YBIT4	YBIT3	YBIT2	YBIT1	YBIT0
Read/Write	R/W							
After reset	-	-	-	-	-	-	-	-

083H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Z	ZBIT7	ZBIT6	ZBIT5	ZBIT4	ZBIT3	ZBIT2	ZBIT1	ZBIT0
Read/Write	R/W							
After reset	-	-	-	-	-	-	-	-

➤ **Example:** Uses Y, Z register as the data pointer to access data in the RAM address 025H of bank0.

```

B0MOV    Y, #00H           ; To set RAM bank 0 for Y register
B0MOV    Z, #25H           ; To set location 25H for Z register
B0MOV    A, @YZ            ; To read a data into ACC
    
```

➤ **Example:** Uses the Y, Z register as data pointer to clear the RAM data.

```

B0MOV    Y, #0             ; Y = 0, bank 0
B0MOV    Z, #07FH         ; Z = 7FH, the last address of the data memory area
    
```

CLR_YZ_BUF:

```

CLR      @YZ               ; Clear @YZ to be zero
    
```

```

DECMS   Z                 ; Z - 1, if Z= 0, finish the routine
JMP     CLR_YZ_BUF        ; Not zero
    
```

```

CLR      @YZ               ; End of clear general purpose data memory area of bank 0
END_CLR:
...
    
```

2.1.6 R REGISTERS

R register is an 8-bit buffer. There are two major functions of the register.

- Can be used as working register
- For store high-byte data of look-up table
(MOVC instruction executed, the high-byte data of specified ROM address will be stored in R register and the low-byte data will be stored in ACC).

082H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
R	RBIT7	RBIT6	RBIT5	RBIT4	RBIT3	RBIT2	RBIT1	RBIT0
Read/Write	R/W							
After reset	-	-	-	-	-	-	-	-

* **Note: Please refer to the “LOOK-UP TABLE DESCRIPTION” about R register look-up table application.**

2.2 ADDRESSING MODE

2.2.1 IMMEDIATE ADDRESSING MODE

The immediate addressing mode uses an immediate data to set up the location in ACC or specific RAM.

- **Example: Move the immediate data 12H to ACC.**

```
MOV      A, #12H      ; To set an immediate data 12H into ACC.
```

- **Example: Move the immediate data 12H to R register.**

```
B0MOV   R, #12H      ; To set an immediate data 12H into R register.
```

* **Note: In immediate addressing mode application, the specific RAM must be 0x80~0x87 working register.**

2.2.2 DIRECTLY ADDRESSING MODE

The directly addressing mode moves the content of RAM location in or out of ACC.

- **Example: Move 0x12 RAM location data into ACC.**

```
B0MOV   A, 12H      ; To get a content of RAM location 0x12 of bank 0 and save in ACC.
```

- **Example: Move ACC data into 0x12 RAM location.**

```
B0MOV   12H, A      ; To get a content of ACC and save in RAM location 12H of bank 0.
```

2.2.3 INDIRECTLY ADDRESSING MODE

The indirectly addressing mode is to access the memory by the data pointer registers (Y/Z).

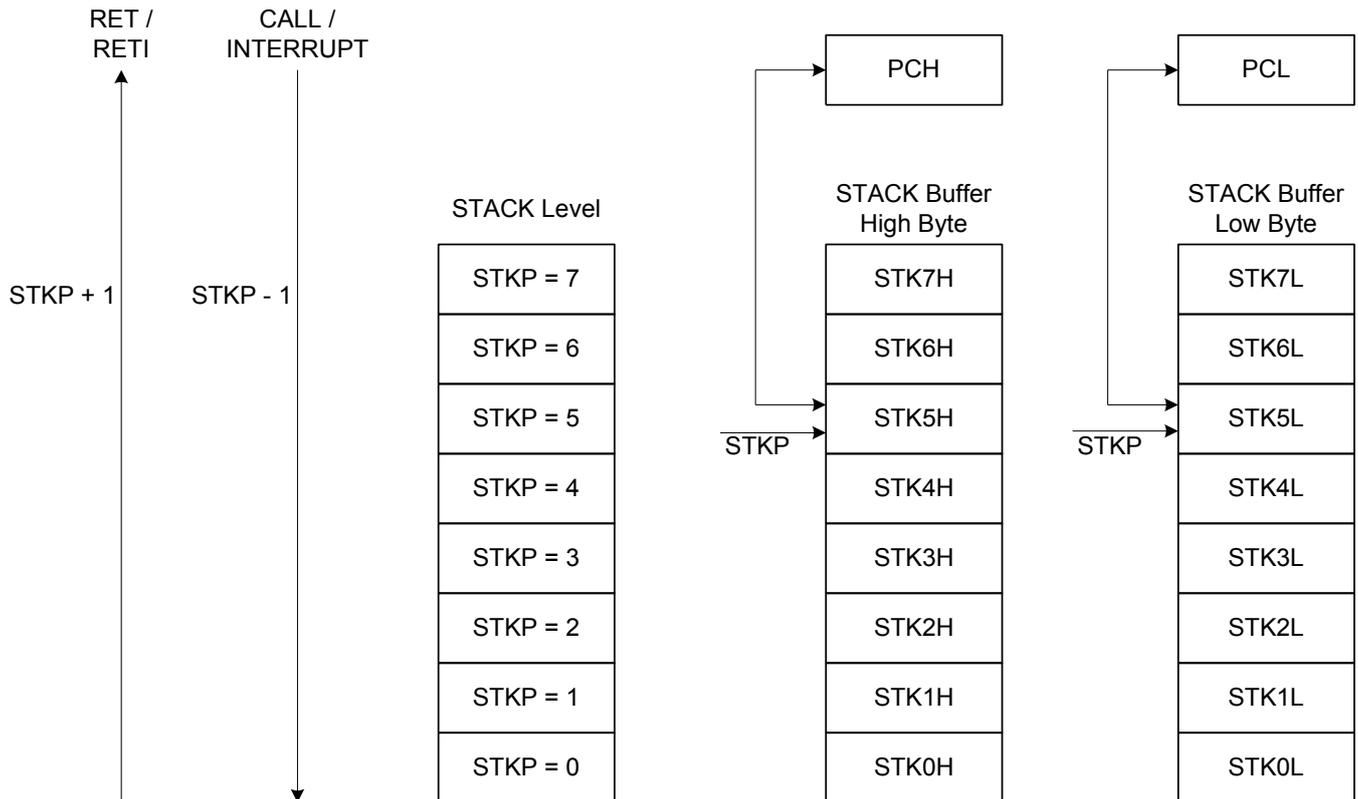

- **Example: Indirectly addressing mode with @YZ register.**

```
B0MOV   Y, #0      ; To clear Y register to access RAM bank 0.
B0MOV   Z, #12H    ; To set an immediate data 12H into Z register.
B0MOV   A, @YZ     ; Use data pointer @YZ reads a data from RAM location
                   ; 012H into ACC.
```

2.3 STACK OPERATION

2.3.1 OVERVIEW

The stack buffer has 8-level. These buffers are designed to push and pop up program counter's (PC) data when interrupt service routine and "CALL" instruction are executed. The STKP register is a pointer designed to point active level in order to push or pop up data from stack buffer. The STKnH and STKnL are the stack buffers to store program counter (PC) data.

2.3.2 STACK REGISTERS

The stack pointer (STKP) is a 3-bit register to store the address used to access the stack buffer, 11-bit data memory (STKnH and STKnL) set aside for temporary storage of stack addresses.

The two stack operations are writing to the top of the stack (push) and reading from the top of stack (pop). Push operation decrements the STKP and the pop operation increments each time. That makes the STKP always point to the top address of stack buffer and write the last program counter value (PC) into the stack buffer.

The program counter (PC) value is stored in the stack buffer before a CALL instruction executed or during interrupt service routine. Stack operation is a LIFO type (Last in and first out). The stack pointer (STKP) and stack buffer (STKnH and STKnL) are located in the system register area bank 0.

0DFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
STKP	GIE	-	-	-	-	STKPB2	STKPB1	STKPB0
Read/Write	R/W	-	-	-	-	R/W	R/W	R/W
After reset	0	-	-	-	-	1	1	1

Bit[2:0] **STKPBn**: Stack pointer (n = 0 ~ 2)

Bit 7 **GIE**: Global interrupt control bit.
0 = Disable.
1 = Enable. Please refer to the interrupt chapter.

- **Example: Stack pointer (STKP) reset, we strongly recommended to clear the stack pointer in the beginning of the program.**

```
MOV     A, #0000111B
B0MOV  STKP, A
```

0F0H~0FFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
STKnH	-	-	SnPC13	SnPC12	SnPC11	SnPC10	SnPC9	SnPC8
Read/Write	-	-	R/W	R/W	R/W	R/W	R/W	R/W
After reset	-	-	0	0	0	0	0	0

0F0H~0FFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
STKnL	SnPC7	SnPC6	SnPC5	SnPC4	SnPC3	SnPC2	SnPC1	SnPC0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

STKn = STKnH , STKnL (n = 7 ~ 0)

2.3.3 STACK OPERATION EXAMPLE

The two kinds of Stack-Save operations refer to the stack pointer (STKP) and write the content of program counter (PC) to the stack buffer are CALL instruction and interrupt service. Under each condition, the STKP decreases and points to the next available stack location. The stack buffer stores the program counter about the op-code address. The Stack-Save operation is as the following table.

Stack Level	STKP Register			Stack Buffer		Description
	STKPB2	STKPB1	STKPB0	High Byte	Low Byte	
0	1	1	1	Free	Free	-
1	1	1	0	STK0H	STK0L	-
2	1	0	1	STK1H	STK1L	-
3	1	0	0	STK2H	STK2L	-
4	0	1	1	STK3H	STK3L	-
5	0	1	0	STK4H	STK4L	-
6	0	0	1	STK5H	STK5L	-
7	0	0	0	STK6H	STK6L	-
8	1	1	1	STK7H	STK7L	-
> 8	1	1	0	-	-	Stack Over, error

There are Stack-Restore operations correspond to each push operation to restore the program counter (PC). The RETI instruction uses for interrupt service routine. The RET instruction is for CALL instruction. When a pop operation occurs, the STKP is incremented and points to the next free stack location. The stack buffer restores the last program counter (PC) to the program counter registers. The Stack-Restore operation is as the following table.

Stack Level	STKP Register			Stack Buffer		Description
	STKPB2	STKPB1	STKPB0	High Byte	Low Byte	
8	1	1	1	STK7H	STK7L	-
7	0	0	0	STK6H	STK6L	-
6	0	0	1	STK5H	STK5L	-
5	0	1	0	STK4H	STK4L	-
4	0	1	1	STK3H	STK3L	-
3	1	0	0	STK2H	STK2L	-
2	1	0	1	STK1H	STK1L	-
1	1	1	0	STK0H	STK0L	-
0	1	1	1	Free	Free	-

3

RESET

3.1 OVERVIEW

The system would be reset in three conditions as following.

- Power on reset
- Watchdog reset
- Brown out reset
- External reset (only supports external reset pin enable situation)

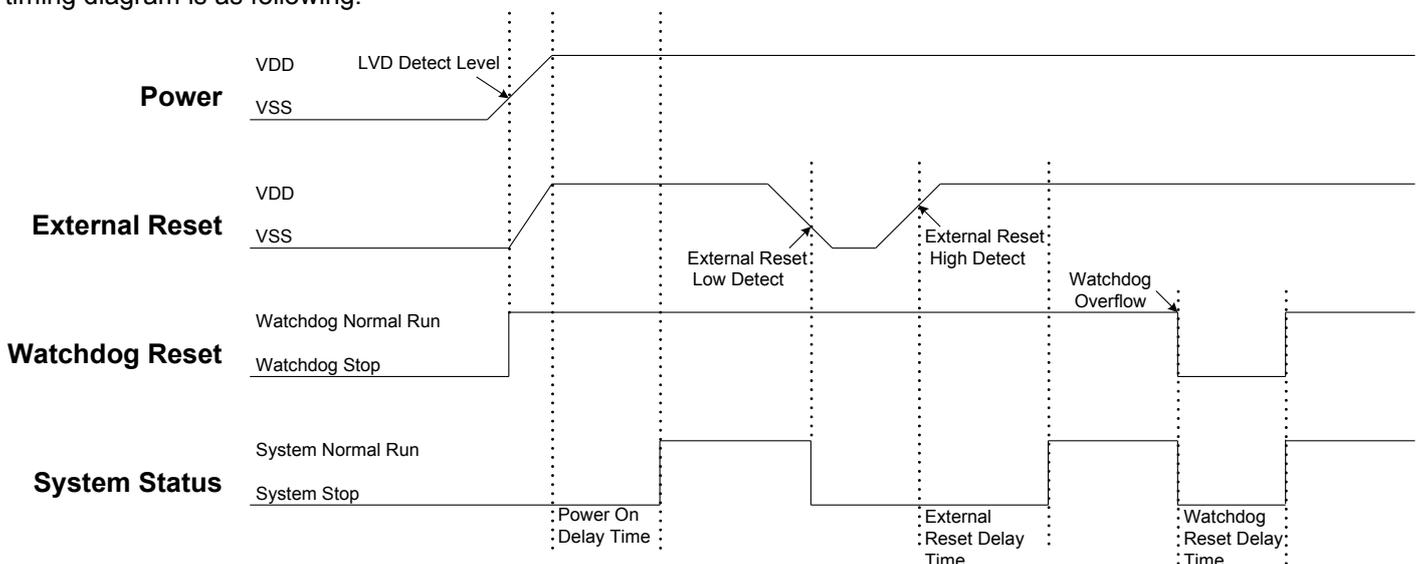

When any reset condition occurs, all system registers keep initial status, program stops and program counter is cleared. After reset status released, the system boots up and program starts to execute from ORG 0. The NT0, NPD flags indicate system reset status. The system can depend on NT0, NPD status and go to different paths by program.

086H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PFLAG	NT0	NPD	-	-	-	C	DC	Z
Read/Write	R/W	R/W	-	-	-	R/W	R/W	R/W
After reset	-	-	-	-	-	0	0	0

Bit [7:6] **NT0, NPD**: Reset status flag.

NT0	NPD	Condition	Description
0	0	Watchdog reset	Watchdog timer overflow.
0	1	Reserved	-
1	0	Power on reset and LVD reset.	Power voltage is lower than LVD detecting level.
1	1	External reset	External reset pin detect low level status.

Finishing any reset sequence needs some time. The system provides complete procedures to make the power on reset successful. For different oscillator types, the reset time is different. That causes the VDD rise rate and start-up time of different oscillator is not fixed. RC type oscillator's start-up time is very short, but the crystal type is longer. Under client terminal application, users have to take care the power on reset time for the master terminal requirement. The reset timing diagram is as following.

3.2 POWER ON RESET

The power on reset depend no LVD operation for most power-up situations. The power supplying to system is a rising curve and needs some time to achieve the normal voltage. Power on reset sequence is as following.

- **Power-up:** System detects the power voltage up and waits for power stable.
- **External reset (only external reset pin enable):** System checks external reset pin status. If external reset pin is not high level, the system keeps reset status and waits external reset pin released.
- **System initialization:** All system registers is set as initial conditions and system is ready.
- **Oscillator warm up:** Oscillator operation is successfully and supply to system clock.
- **Program executing:** Power on sequence is finished and program executes from ORG 0.

3.3 WATCHDOG RESET

Watchdog reset is a system protection. In normal condition, system works well and clears watchdog timer by program. Under error condition, system is in unknown situation and watchdog can't be clear by program before watchdog timer overflow. Watchdog timer overflow occurs and the system is reset. After watchdog reset, the system restarts and returns normal mode. Watchdog reset sequence is as following.

- **Watchdog timer status:** System checks watchdog timer overflow status. If watchdog timer overflow occurs, the system is reset.
- **System initialization:** All system registers is set as initial conditions and system is ready.
- **Oscillator warm up:** Oscillator operation is successfully and supply to system clock.
- **Program executing:** Power on sequence is finished and program executes from ORG 0.

Watchdog timer application note is as following.

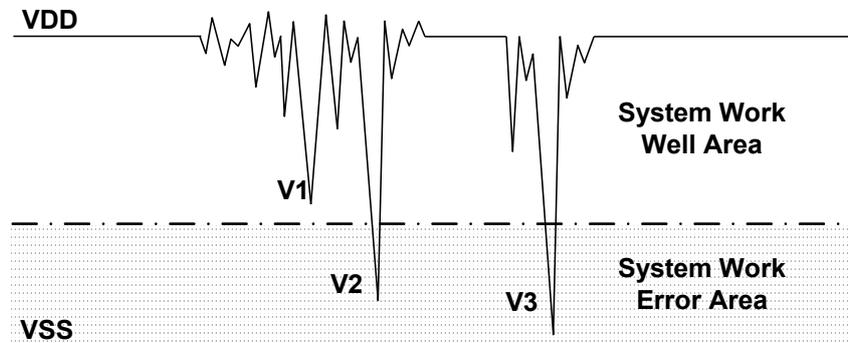

- Before clearing watchdog timer, check I/O status and check RAM contents can improve system error.
- Don't clear watchdog timer in interrupt vector and interrupt service routine. That can improve main routine fail.
- Clearing watchdog timer program is only at one part of the program. This way is the best structure to enhance the watchdog timer function.

* **Note:** Please refer to the "WATCHDOG TIMER" about watchdog timer detail information.

3.4 BROWN OUT RESET

3.4.1 BROWN OUT DESCRIPTION

The brown out reset is a power dropping condition. The power drops from normal voltage to low voltage by external factors (e.g. EFT interference or external loading changed). The brown out reset would make the system not work well or executing program error.

Brown Out Reset Diagram

The power dropping might through the voltage range that's the system dead-band. The dead-band means the power range can't offer the system minimum operation power requirement. The above diagram is a typical brown out reset diagram. There is a serious noise under the VDD, and VDD voltage drops very deep. There is a dotted line to separate the system working area. The above area is the system work well area. The below area is the system work error area called dead-band. V1 doesn't touch the below area and not effect the system operation. But the V2 and V3 is under the below area and may induce the system error occurrence. Let system under dead-band includes some conditions.

DC application:

The power source of DC application is usually using battery. When low battery condition and MCU drive any loading, the power drops and keeps in dead-band. Under the situation, the power won't drop deeper and not touch the system reset voltage. That makes the system under dead-band.

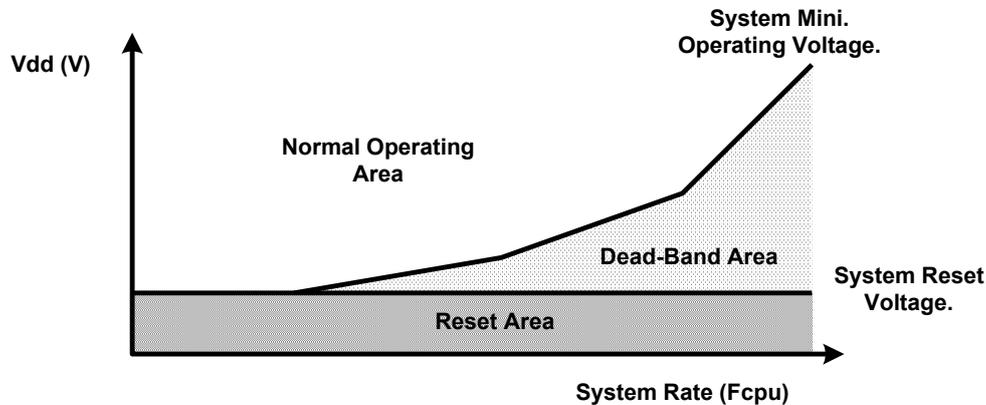

AC application:

In AC power application, the DC power is regulated from AC power source. This kind of power usually couples with AC noise that makes the DC power dirty. Or the external loading is very heavy, e.g. driving motor. The loading operating induces noise and overlaps with the DC power. VDD drops by the noise, and the system works under unstable power situation.

The power on duration and power down duration are longer in AC application. The system power on sequence protects the power on successful, but the power down situation is like DC low battery condition. When turn off the AC power, the VDD drops slowly and through the dead-band for a while.

3.4.2 THE SYSTEM OPERATING VOLTAGE DECSRIPTION

To improve the brown out reset needs to know the system minimum operating voltage which is depend on the system executing rate and power level. Different system executing rates have different system minimum operating voltage. The electrical characteristic section shows the system voltage to executing rate relationship.

Normally the system operation voltage area is higher than the system reset voltage to VDD, and the reset voltage is decided by LVD detect level. The system minimum operating voltage rises when the system executing rate upper even higher than system reset voltage. The dead-band definition is the system minimum operating voltage above the system reset voltage.

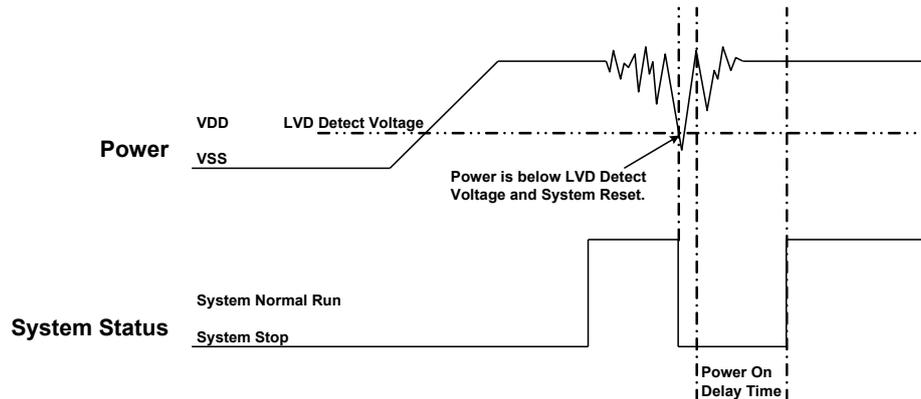

3.4.3 BROWN OUT RESET IMPROVEMENT

How to improve the brown reset condition? There are some methods to improve brown out reset as following.

- LVD reset
- Watchdog reset
- Reduce the system executing rate
- External reset circuit. (Zener diode reset circuit, Voltage bias reset circuit, External reset IC)

* **Note:**

1. The " Zener diode reset circuit", "Voltage bias reset circuit" and "External reset IC" can completely improve the brown out reset, DC low battery and AC slow power down conditions.
2. For AC power application and enhance EFT performance, the system clock is 4MHz/4 (1 mips) and use external reset (" Zener diode reset circuit", "Voltage bias reset circuit", "External reset IC"). The structure can improve noise effective and get good EFT characteristic.

LVD reset:

The LVD (low voltage detector) is built-in Sonix 8-bit MCU to be brown out reset protection. When the VDD drops and is below LVD detect voltage, the LVD would be triggered, and the system is reset. The LVD detect level is different by each MCU. The LVD voltage level is a point of voltage and not easy to cover all dead-band range. Using LVD to improve brown out reset is depend on application requirement and environment. If the power variation is very deep, violent and trigger the LVD, the LVD can be the protection. If the power variation can touch the LVD detect level and make system work error, the LVD can't be the protection and need to other reset methods. More detail LVD information is in the electrical characteristic section.

Watchdog reset:

The watchdog timer is a protection to make sure the system executes well. Normally the watchdog timer would be clear at one point of program. Don't clear the watchdog timer in several addresses. The system executes normally and the watchdog won't reset system. When the system is under dead-band and the execution error, the watchdog timer can't be clear by program. The watchdog is continuously counting until overflow occurrence. The overflow signal of watchdog timer triggers the system to reset, and the system return to normal mode after reset sequence. This method also can improve brown out reset condition and make sure the system to return normal mode.

If the system reset by watchdog and the power is still in dead-band, the system reset sequence won't be successful and the system stays in reset status until the power return to normal range.

Reduce the system executing rate:

If the system rate is fast and the dead-band exists, to reduce the system executing rate can improve the dead-band. The lower system rate is with lower minimum operating voltage. Select the power voltage that's no dead-band issue and find out the mapping system rate. Adjust the system rate to the value and the system exits the dead-band issue. This way needs to modify whole program timing to fit the application requirement.

External reset circuit:

The external reset methods also can improve brown out reset and is the complete solution. There are three external reset circuits to improve brown out reset including "Zener diode reset circuit", "Voltage bias reset circuit" and "External reset IC". These three reset structures use external reset signal and control to make sure the MCU be reset under power dropping and under dead-band. The external reset information is described in the next section.

3.5 EXTERNAL RESET

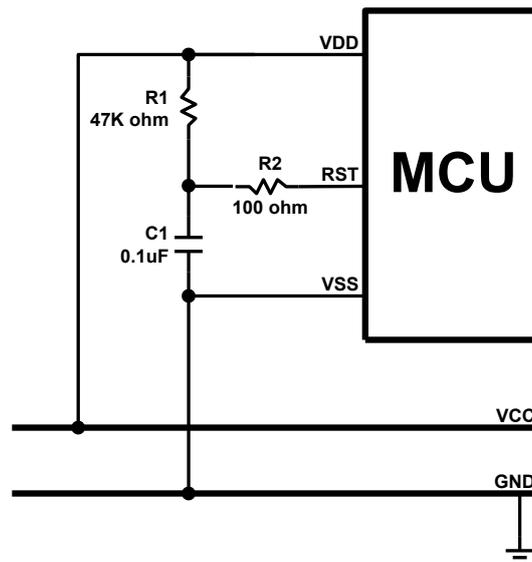

External reset function is controlled by “Reset_Pin” code option. Set the code option as “Reset” option to enable external reset function. External reset pin is Schmitt Trigger structure and low level active. The system is running when reset pin is high level voltage input. The reset pin receives the low voltage and the system is reset. The external reset operation activates in power on and normal running mode. During system power-up, the external reset pin must be high level input, or the system keeps in reset status. External reset sequence is as following.

- **External reset (only external reset pin enable):** System checks external reset pin status. If external reset pin is not high level, the system keeps reset status and waits external reset pin released.
- **System initialization:** All system registers is set as initial conditions and system is ready.
- **Oscillator warm up:** Oscillator operation is successfully and supply to system clock.
- **Program executing:** Power on sequence is finished and program executes from ORG 0.

The external reset can reset the system during power on duration, and good external reset circuit can protect the system to avoid working at unusual power condition, e.g. brown out reset in AC power application...

3.6 EXTERNAL RESET CIRCUIT

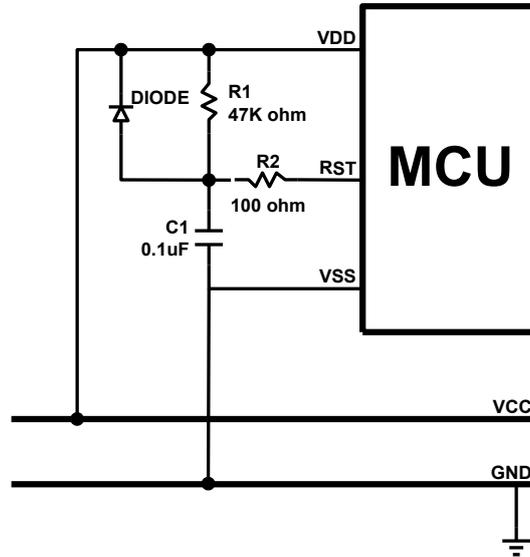

3.6.1 Simply RC Reset Circuit

This is the basic reset circuit, and only includes R1 and C1. The RC circuit operation makes a slow rising signal into reset pin as power up. The reset signal is slower than VDD power up timing, and system occurs a power on signal from the timing difference.

* **Note: The reset circuit is no any protection against unusual power or brown out reset.**

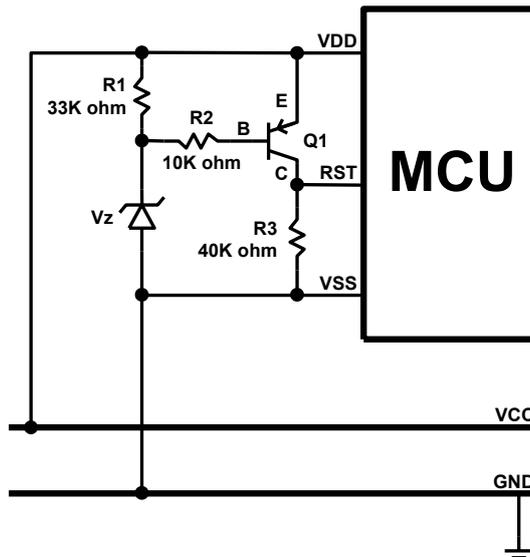

3.6.2 Diode & RC Reset Circuit

This is the better reset circuit. The R1 and C1 circuit operation is like the simply reset circuit to make a power on signal. The reset circuit has a simply protection against unusual power. The diode offers a power positive path to conduct higher power to VDD. It is can make reset pin voltage level to synchronize with VDD voltage. The structure can improve slight brown out reset condition.

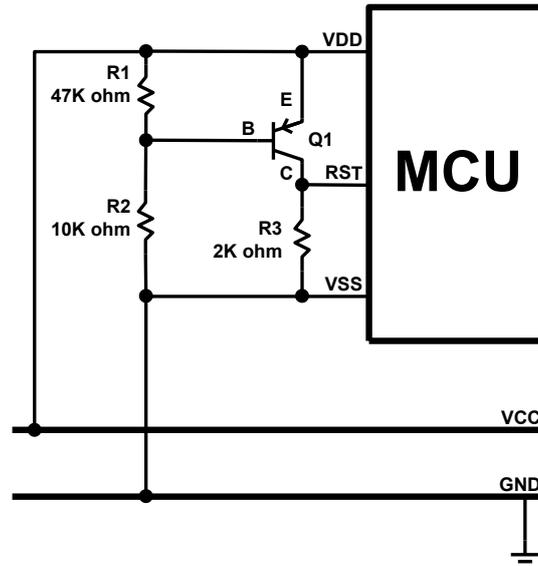

* **Note:** The R2 100 ohm resistor of “Simply reset circuit” and “Diode & RC reset circuit” is necessary to limit any current flowing into reset pin from external capacitor C in the event of reset pin breakdown due to Electrostatic Discharge (ESD) or Electrical Over-stress (EOS).

3.6.3 Zener Diode Reset Circuit

The zener diode reset circuit is a simple low voltage detector and can **improve brown out reset condition completely**. Use zener voltage to be the active level. When VDD voltage level is above “ $V_z + 0.7V$ ”, the C terminal of the PNP transistor outputs high voltage and MCU operates normally. When VDD is below “ $V_z + 0.7V$ ”, the C terminal of the PNP transistor outputs low voltage and MCU is in reset mode. Decide the reset detect voltage by zener specification. Select the right zener voltage to conform the application.

3.6.4 Voltage Bias Reset Circuit

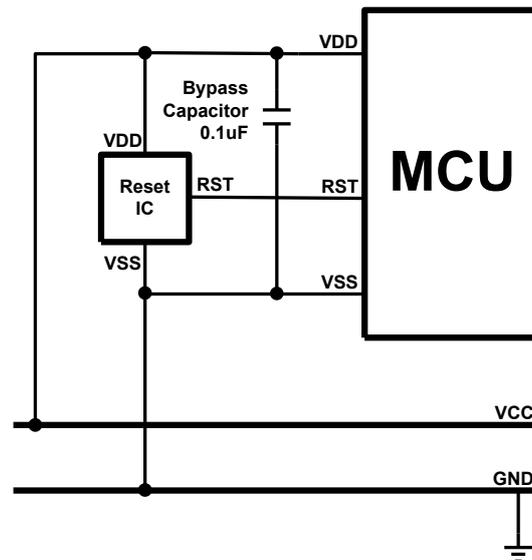

The voltage bias reset circuit is a low cost voltage detector and can **improve brown out reset condition completely**. The operating voltage is not accurate as zener diode reset circuit. Use R1, R2 bias voltage to be the active level. When VDD voltage level is above or equal to $0.7V \times (R1 + R2) / R1$, the C terminal of the PNP transistor outputs high voltage and MCU operates normally. When VDD is below $0.7V \times (R1 + R2) / R1$, the C terminal of the PNP transistor outputs low voltage and MCU is in reset mode.

Decide the reset detect voltage by R1, R2 resistances. Select the right R1, R2 value to conform the application. In the circuit diagram condition, the MCU's reset pin level varies with VDD voltage variation, and the differential voltage is 0.7V. If the VDD drops and the voltage lower than reset pin detect level, the system would be reset. If want to make the reset active earlier, set the $R2 > R1$ and the cap between VDD and C terminal voltage is larger than 0.7V. The external reset circuit is with a stable current through R1 and R2. For power consumption issue application, e.g. DC power system, the current must be considered to whole system power consumption.

*** Note: Under unstable power condition as brown out reset, "Zener diode rest circuit" and "Voltage bias reset circuit" can protects system no any error occurrence as power dropping. When power drops below the reset detect voltage, the system reset would be triggered, and then system executes reset sequence. That makes sure the system work well under unstable power situation.**

3.6.5 External Reset IC

The external reset circuit also use external reset IC to enhance MCU reset performance. This is a high cost and good effect solution. By different application and system requirement to select suitable reset IC. The reset circuit can improve all power variation.

4 SYSTEM CLOCK

4.1 OVERVIEW

The micro-controller is a dual clock system. There are high-speed clock and low-speed clock. The high-speed clock is generated from the external oscillator & on-chip PLL circuit. The low-speed clock is generated from on-chip low-speed RC oscillator circuit (ILRC 24 KHz).

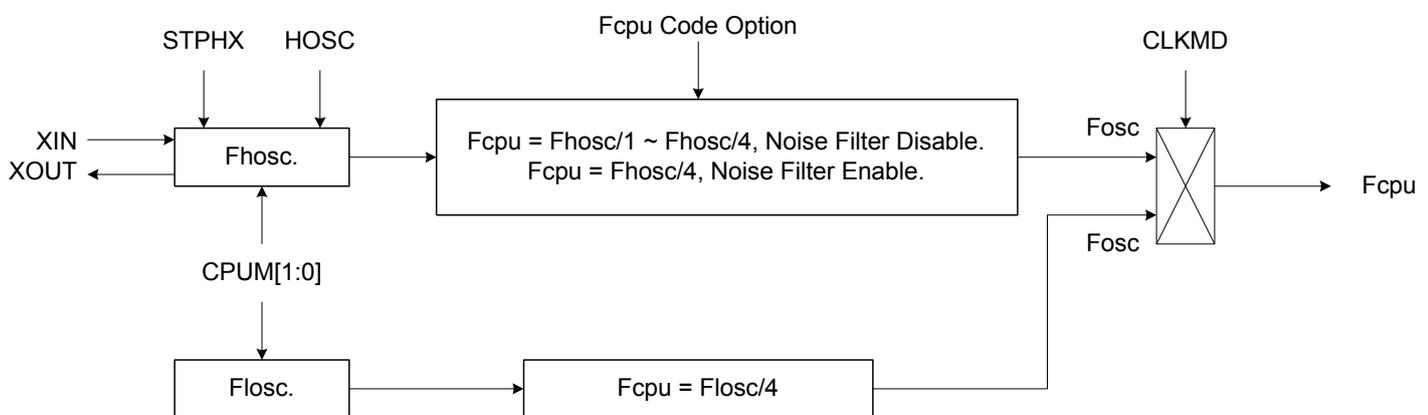

Both the high-speed clock and the low-speed clock can be system clock (Fosc). The system clock in slow mode is divided by 4 to be the instruction cycle (Fcpu).

☞ **Normal Mode (High Clock):** $F_{cpu} = F_{osc} / N$, $N = 1 \sim 4$, Select N by Fcpu code option.

☞ **Slow Mode (Low Clock):** $F_{cpu} = F_{osc}/4$.

SONiX provides a “Noise Filter” controlled by code option. In high noisy situation, the noise filter can isolate noise outside and protect system works well. The minimum Fcpu of high clock is limited at $F_{osc}/4$ when noise filter enable.

4.2 CLOCK BLOCK DIAGRAM

- HOSC: High_Clk code option.
- Fosc: External high-speed clock.
- Fosc: Internal low-speed RC clock (Typical 24 KHz).
- Fosc: System clock source.
- Fcpu: Instruction cycle.

4.3 OSCM REGISTER

The OSCM register is an oscillator control register. It controls oscillator status, system mode.

OCAH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
OSCM	-	-	-	CPUM1	CPUM0	CLKMD	STPHX	-
Read/Write	-	-	-	R/W	R/W	R/W	R/W	-
After reset	-	-	-	0	0	0	0	-

- Bit 1 **STPHX**: External high-speed oscillator control bit.
 0 = External high-speed oscillator free run.
 1 = External high-speed oscillator free run stop. Internal low-speed RC oscillator is still running.
- Bit 2 **CLKMD**: System high/Low clock mode control bit.
 0 = Normal (dual) mode. System clock is high clock.
 1 = Slow mode. System clock is internal low clock.
- Bit[4:3] **CPUM[1:0]**: CPU operating mode control bits.
 00 = normal.
 01 = sleep (power down) mode.
 10 = green mode.
 11 = reserved.

➤ **Example: Stop high-speed oscillator and PLL circuit.**

B0BSET FSTPHX ; To stop external high-speed oscillator only.

Example: When entering the power down mode (sleep mode), both high-speed external oscillator, PLL circuit and internal low-speed oscillator will be stopped.

B0BSET FCPUM0 ; To stop external high-speed oscillator and internal low-speed
 ; oscillator called power down mode (sleep mode).

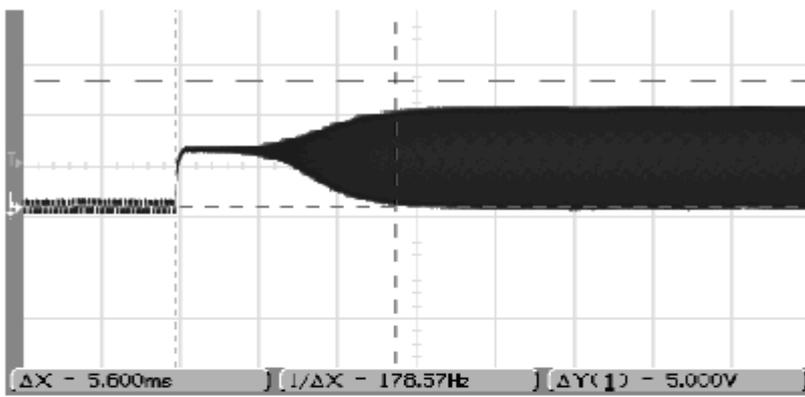

4.4 SYSTEM HIGH CLOCK

The system high clock is from the in circuit PLL. User must select the external oscillator 6MHz X'tal, 12MHz X'tal or 16MHz X'tal by the code option "Ext_OSC", and the entire three clock source will input to the on-chip PLL circuit. PLL will output 12MHz to system clock (Fosc).

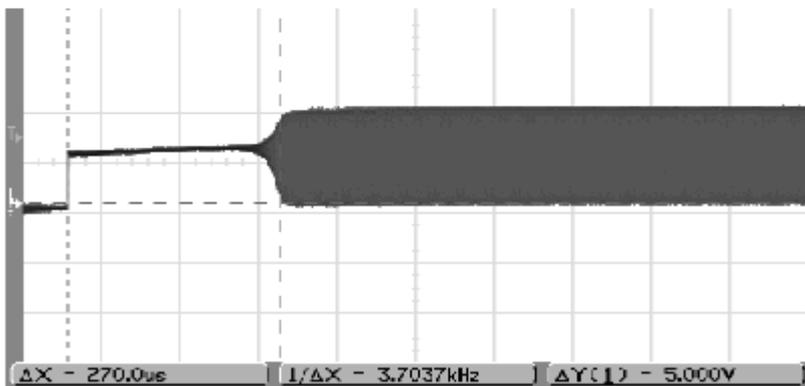

4.4.1 EXTERNAL HIGH CLOCK

External high clock includes three modules (Crystal and external clock signal). The start up time of crystal and ceramic oscillator is different. The oscillator start-up time decides reset time length.

4MHz Crystal

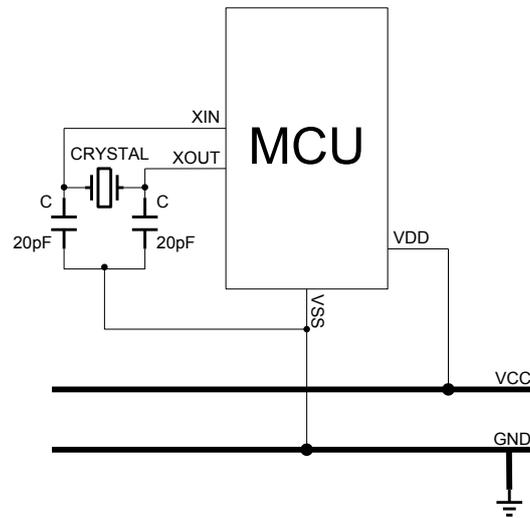

4MHz Ceramic

4.4.1.1 CRYSTAL

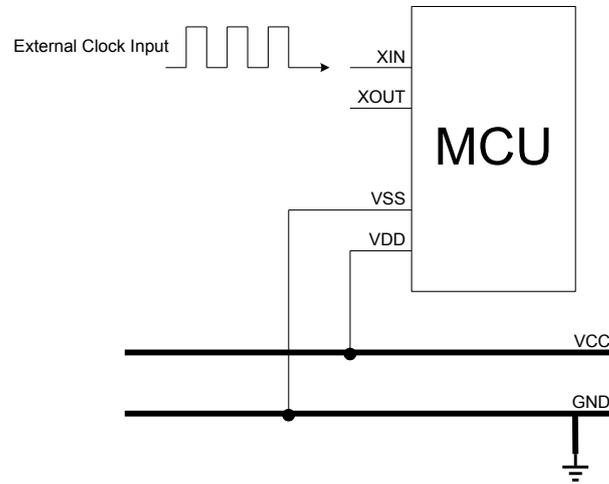

Crystal devices are driven by XIN, XOUT pins.

* **Note:** Connect the Crystal and C as near as possible to the XIN/XOUT/VSS pins of micro-controller.

4.4.1.2 EXTERNAL CLOCK SIGNAL

Selecting external clock signal input to be the input clock source is by the “Ext_OSC” code option. The external clock signal is input from XIN pin. XOUT pin is general purpose I/O pin.

* **Note:** The GND of external oscillator circuit must be as near as possible to VSS pin of micro-controller.

4.4.1.3 SYSTEM LOW CLOCK

The system low clock source is the internal low-speed oscillator built in the micro-controller. The low-speed oscillator uses RC type oscillator circuit. The frequency is affected by the voltage and temperature of the system. In common condition, the frequency of the RC oscillator is about 24KHz.

The internal low RC supports watchdog clock source and system slow mode controlled by CLKMD.

☞ ***Fosc = Internal low RC oscillator (24KHz).***

☞ ***Slow mode Fcpu = Fosc / 4***

There are two conditions to stop internal low RC. One is power down mode, and the other is green mode of 24K mode and watchdog disable. If system is in 24K mode and watchdog disable, only 24K oscillator activates and system is under low power consumption.

➤ **Example: Stop internal low-speed oscillator by power down mode.**

```
B0BSET    FCPUM0    ; To stop external high-speed oscillator and internal low-speed  
           ; oscillator called power down mode (sleep mode).
```

* **Note: The internal low-speed clock can't be turned off individually. It is controlled by CPUM0, CPUM1 (24K, watchdog disable) bits of OSCM register.**

4.4.2 SYSTEM CLOCK MEASUREMENT

Under design period, the users can measure system clock speed by software instruction cycle (Fcpu). This way is useful in RC mode.

Example: Fcpu instruction cycle of external oscillator.

```
B0BSET    P0M.0           ; Set P0.0 to be output mode for outputting Fcpu toggle signal.
```

@@:

```
B0BSET    P0.0           ; Output Fcpu toggle signal in low-speed clock mode.
B0BCLR    P0.0           ; Measure the Fcpu frequency by oscilloscope.
JMP       @B
```

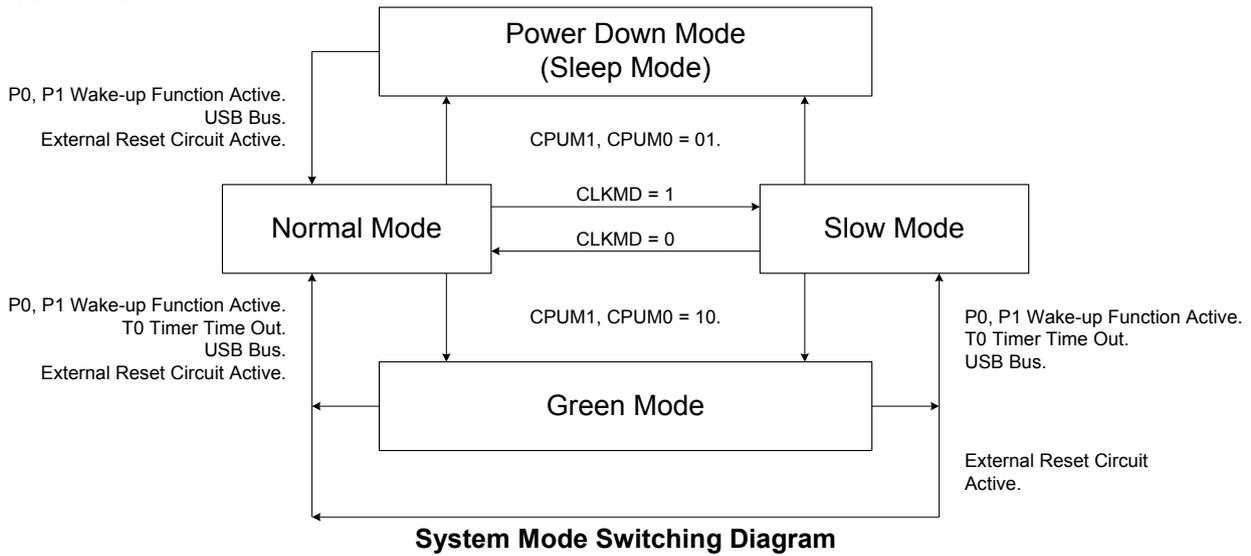

* **Note: Do not measure the RC frequency directly from XIN; the probe impedance will affect the RC frequency.**

5 SYSTEM OPERATION MODE

5.1 OVERVIEW

The chip is featured with low power consumption by switching around four different modes as following.

- High-speed mode
- Low-speed mode
- Power-down mode (Sleep mode)
- Green mode

Operating mode description

MODE	NORMAL	SLOW	GREEN	POWER DOWN (SLEEP)	REMARK
HOSC	Running	By STPHX	By STPHX	Stop

External interrupt	All active	All active	All active	All inactive	
Wakeup source	-	-	P0, P1, T0, Reset	P0, P1, Reset	

- **HOSC:** high clock (Fosc = 12MHz)
- **ILRC:** Internal low clock (12KHz RC oscillator)

5.2 SYSTEM MODE SWITCHING EXAMPLE

- **Example: Switch normal/slow mode to power down (sleep) mode.**

```
B0BSET      FCPUM0      ; Set CPUM0 = 1.
```

* **Note: During the sleep, only the wakeup pin and reset can wakeup the system back to the normal mode.**

- **Example: Switch normal mode to slow mode.**

```
B0BSET      FCLKMD      ;To set CLKMD = 1, Change the system into slow mode
B0BSET      FSTPHX      ;To stop external high-speed oscillator for power saving.
```

- **Example: Switch slow mode to normal mode (The external high-speed oscillator is still running).**

```
B0BCLR      FCLKMD      ;To set CLKMD = 0
```

- Example: Switch slow mode to normal mode (The external high-speed oscillator stops).**

If external high clock stop and program want to switch back normal mode. It is necessary to delay at least 10mS for external clock stable.

```

B0BCLR      FSTPHX      ; Turn on the external high-speed oscillator.

MOV         A, #10      ; internal RC=12KHz (typical) will delay
B0MOV      Z, A
@@:         DECMS      Z      ; 0.33ms X 30 ~ 10ms for external clock stable
           JMP         @B
           ;
B0BCLR      FCLKMD      ; Change the system back to the normal mode

```

- Example: Switch normal/slow mode to green mode.**

```
B0BSET      FCPUM1      ; Set CPUM1 = 1.
```

* **Note: If T0 timer wakeup function is disabled in the green mode, only the wakeup pin and reset pin can wakeup the system backs to the previous operation mode.**

Example: Switch normal/slow mode to green mode and enable T0 wake-up function.

; Set T0 timer wakeup function.

B0BCLR	FT0IEN	; To disable T0 interrupt service
B0BCLR	FT0ENB	; To disable T0 timer
MOV	A,#20H	;
B0MOV	T0M,A	; To set T0 clock = Fcpu / 64
MOV	A,#74H	;
B0MOV	T0C,A	; To set T0C initial value = 74H (To set T0 interval = 10 ms)
B0BCLR	FT0IEN	; To disable T0 interrupt service
B0BCLR	FT0IRQ	; To clear T0 interrupt request
B0BSET	FT0ENB	; To enable T0 timer

; Go into green mode

B0BCLR	FCPUM0	;To set CPUMx = 10
B0BSET	FCPUM1	

* **Note: During the green mode with T0 wake-up function, the wakeup pin and T0 wakeup the system back to the last mode. T0 wake-up period is controlled by program.**

5.3 WAKEUP

5.3.1 OVERVIEW

Under power down mode (sleep mode) or green mode, program doesn't execute. The wakeup trigger can wake the system up to normal mode or slow mode. The wakeup trigger sources are external trigger (P0, P1 level change), internal trigger (T0 timer overflow) and USB bus toggle.

- Power down mode is waked up to normal mode. The wakeup trigger is only external trigger (P0, P1 level change and USB bus toggle)
- Green mode is waked up to last mode (normal mode or slow mode). The wakeup triggers are external trigger (P0, P1 level change), internal trigger (T0 timer overflow) and USB bus toggle.

5.3.2 WAKEUP TIME

When the system is in power down mode (sleep mode), the high clock oscillator stops. When waked up from power down mode, MCU waits for 16384 external 6MHz clocks as the wakeup time to stable the oscillator circuit. After the wakeup time, the system goes into the normal mode.

* **Note: Wakeup from green mode is no wakeup time because the clock doesn't stop in green mode.**

The value of the wakeup time is as the following.

“16M_X'tal/12M_X'tal/6M_X'tal” mode:

The Wakeup time = $1/F_{osc} * 16384$ (sec) + high clock start-up time

* **Note: The high clock start-up time is depended on the VDD and oscillator type of high clock.**

Example: In 16M_X'tal/12M_X'tal/6M_X'tal mode and power down mode (sleep mode), the system is waked up. After the wakeup time, the system goes into normal mode. The wakeup time is as the following.

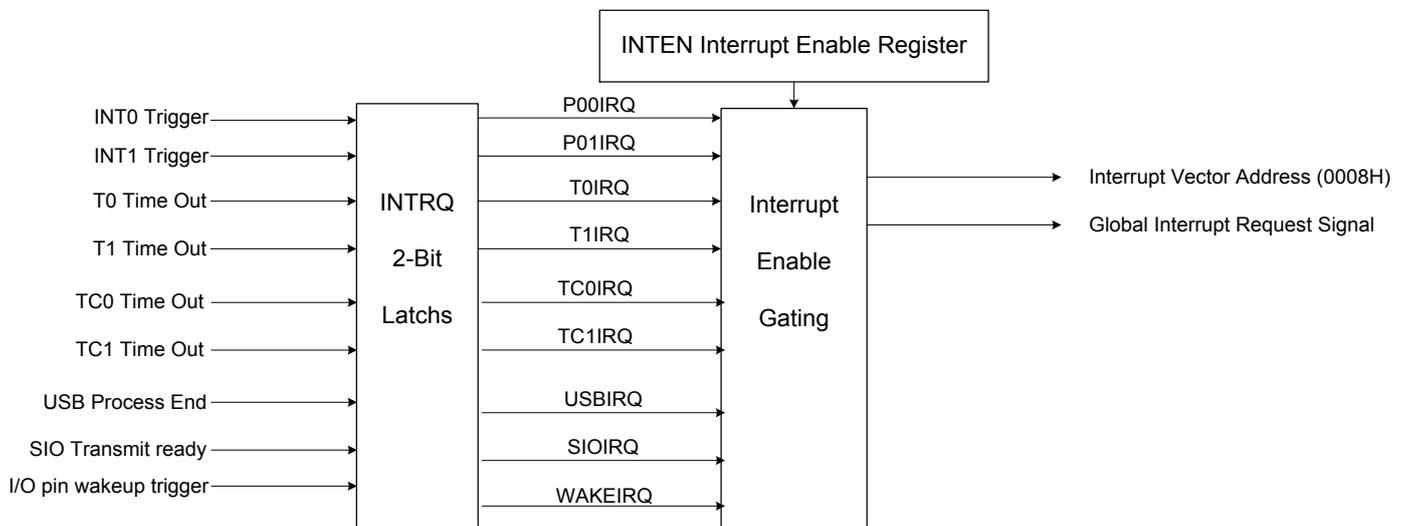

The wakeup time = $1/6\text{MHz} * 16384 = 2.72$ ms

The total wakeup time = 2.72 ms + oscillator start-up time

6 INTERRUPT

6.1 OVERVIEW

This MCU provides 9 interrupt sources, including 6 internal interrupt (T0/T1/TC0/TC1/USB/SIO) and two external interrupt (INT0/INT1). The external interrupt can wakeup the chip while the system is switched from power down mode to high-speed normal mode. Once interrupt service is executed, the GIE bit in STKP register will clear to “0” for stopping other interrupt request. On the contrast, when interrupt service exits, the GIE bit will set to “1” to accept the next interrupts’ request. All of the interrupt request signals are stored in INTRQ register.

* **Note: The GIE bit must enable during all interrupt operation.**

6.2 INTEN INTERRUPT ENABLE REGISTER

INTEN is the interrupt request control register including one internal interrupts, one external interrupts enable control bits. One of the register to be set "1" is to enable the interrupt request function. Once of the interrupt occur, the stack is incremented and program jump to ORG 8 to execute interrupt service routines. The program exits the interrupt service routine when the returning interrupt service routine instruction (RETI) is executed.

0C7H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
INTEN1							TC1IEN	TC0IEN
Read/Write							R/W	R/W
After reset							0	0

Bit 0 **TC0IEN:** TC0 timer interrupt control bit.
0 = Disable TC0 interrupt function.
1 = Enable TC0 interrupt function.

Bit 1 **TC1IEN:** TC1 timer interrupt control bit.
0 = Disable TC1 interrupt function.
1 = Enable TC1 interrupt function.

0C9H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
INTEN	SOFIEN	USBIEN	T1IEN	T0IEN	SIOIEN	WAKEIEN	P01IEN	P00IEN
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

Bit 0 **P00IEN:** External P0.0 interrupt (INT0) control bit.
0 = Disable INT0 interrupt function.
1 = Enable INT0 interrupt function.

Bit 1 **P01IEN:** External P0.1 interrupt (INT1) control bit.
0 = Disable INT1 interrupt function.
1 = Enable INT1 interrupt function.

Bit 2 **WAKEIEN:** I/O PORT0 & PORT 1 WAKEUP interrupt control bit.
0 = Disable WAKEUP interrupt function.
1 = Enable WAKEUP interrupt function.

Bit 3 **SIOIEN:** SIO interrupt control bit.
0 = Disable SIO interrupt function.
1 = Enable SIO interrupt function.

Bit 4 **T0IEN:** T0 timer interrupt control bit.
0 = Disable T0 interrupt function.
1 = Enable T0 interrupt function.

Bit 5 **T1IEN:** T1 timer interrupt control bit.
0 = Disable T1 interrupt function.
1 = Enable T1 interrupt function.

Bit 6 **USBIEN:** USB interrupt control bit.
0 = Disable USB interrupt function.
1 = Enable USB interrupt function.

Bit 7 **SOFIEN:** USB SOF interrupt control bit. Control this SOF interrupt with the USB_INT_EN register.
0 = Disable USB SOF interrupt function.
1 = Enable USB SOF interrupt function.

6.3 INTRQ INTERRUPT REQUEST REGISTER

INTRQ is the interrupt request flag register. The register includes all interrupt request indication flags. Each one of the interrupt requests occurs; the bit of the INTRQ register would be set “1”. The INTRQ value needs to be clear by programming after detecting the flag. In the interrupt vector of the program, users know the any interrupt requests occurring by the register and do the routine corresponding of the interrupt request.

0C6H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
INTRQ1							TC1IRQ	TC0IRQ
Read/Write							R/W	R/W
After reset							0	0

Bit 0 **TC0IRQ:** TC0 timer interrupt request flag.
0 = None TC0 interrupt request.
1 = T0 interrupt request.

Bit 1 **TC1IRQ:** TC1 timer interrupt request flag.
0 = None TC1 interrupt request.
1 = T0 interrupt request.

0C8H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
INTRQ	SOFIRQ	USBIRQ	T1IRQ	T0IRQ	SIOIRQ	WAKEIRQ	P01IRQ	P00IRQ
Read/Write	RW	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

Bit 0 **P00IRQ:** External P0.0 interrupt (INT0) request flag.
0 = None INT0 interrupt request.
1 = INT0 interrupt request.

Bit 1 **P01IRQ:** External P0.1 interrupt (INT1) request flag.
0 = None INT0 interrupt request.
1 = INT0 interrupt request.

Bit 2 **WAKEIRQ:** I/O PORT0 & PORT1 WAKEUP interrupt request flag.
0 = None WAKEUP interrupt request.
1 = WAKEUP interrupt request.

Bit 3 **SIOIRQ:** SIO interrupt request flag.
0 = None SIO interrupt request.
1 = SIO interrupt request.

Bit 4 **T0IRQ:** T0 timer interrupt request flag.
0 = None T0 interrupt request.
1 = T0 interrupt request.

Bit 5 **T1IRQ:** T1 timer interrupt request flag.
0 = None T1 interrupt request.
1 = T1 interrupt request.

Bit 6 **USBIRQ:** USB interrupt request flag.
0 = None USB interrupt request.
1 = USB interrupt request.

Bit 7 **SOFIRQ:** USB SOF interrupt request flag. Control this SOF interrupt with the USTATUS register.
0 = None USB SOF interrupt request.
1 = USB SOF interrupt request.

6.4 GIE GLOBAL INTERRUPT OPERATION

GIE is the global interrupt control bit. All interrupts start work after the GIE = 1. It is necessary for interrupt service request. One of the interrupt requests occurs, and the program counter (PC) points to the interrupt vector (ORG 8) and the stack add 1 level.

ODFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
STKP	GIE	-	-	-	-	STKPB2	STKPB1	STKPB0
Read/Write	R/W	-	-	-	-	R/W	R/W	R/W
After reset	0	-	-	-	-	1	1	1

Bit 7 **GIE:** Global interrupt control bit.
0 = Disable global interrupt.
1 = Enable global interrupt.

Example: Set global interrupt control bit (GIE).

```
BOBSET            FGIE                    ; Enable GIE
```

*** Note: The GIE bit must enable during all interrupt operation.**

6.5 PUSH, POP ROUTINE

When any interrupt occurs, system will jump to ORG 8 and execute interrupt service routine. It is necessary to save ACC, PFLAG data. The chip includes "PUSH", "POP" for in/out interrupt service routine. The two instructions save and load ACC, PFLAG data into buffers and avoid main routine error after interrupt service routine finishing.

*** Note: "PUSH", "POP" instructions save and load ACC/PFLAG without (NT0, NPD). PUSH/POP buffer is an unique buffer and only one level.**

➤ **Example: Store ACC and PAFLG data by PUSH, POP instructions when interrupt service routine executed.**

```

ORG            0
JMP            START

ORG            8
JMP            INT_SERVICE

ORG            10H
START:
...

INT_SERVICE:
  PUSH                                    ; Save ACC and PFLAG to buffers.
  ...
  ...
  POP                                     ; Load ACC and PFLAG from buffers.
  RETI                                    ; Exit interrupt service vector
  ...
  ENDP

```

6.6 INT0 (P0.0) & INT1 (P0.1) INTERRUPT OPERATION

When the INT0/INT1 trigger occurs, the P00IRQ/P01IRQ will be set to “1” no matter the P00IEN/P01IEN is enable or disable. If the P00IEN/P01IEN = 1 and the trigger event P00IRQ/P01IRQ is also set to be “1”. As the result, the system will execute the interrupt vector (ORG 8). If the P00IEN/P01IEN = 0 and the trigger event P00IRQ/P01IRQ is still set to be “1”. Moreover, the system won’t execute interrupt vector even when the P00IRQ/P01IRQ is set to be “1”. Users need to be cautious with the operation under multi-interrupt situation.

If the interrupt trigger direction is identical with wake-up trigger direction, the INT0/INT1 interrupt request flag (INT0IRQ/INT1IRQ) is latched while system wake-up from power down mode or green mode by P0.0 wake-up trigger. System inserts to interrupt vector (ORG 8) after wake-up immediately.

* **Note: INT0 interrupt request can be latched by P0.0 wake-up trigger.**
 * **Note: INT1 interrupt request can be latched by P0.1 wake-up trigger.**

* **Note: The interrupt trigger direction of P0.0/P0.1 is control by PEDGE register.**

0BFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PEDGE					P01G1	P01G0	P00G1	P00G0
Read/Write					R/W	R/W	R/W	R/W
After reset					1	0	1	0

Bit[3:2] **P01G[1:0]**: P0.1 interrupt trigger edge control bits.
 00 = reserved.
 01 = rising edge.
 10 = falling edge.
 11 = rising/falling bi-direction (Level change trigger).

Bit[1:0] **P00G[1:0]**: P0.0 interrupt trigger edge control bits.
 00 = reserved.
 01 = rising edge.
 10 = falling edge.
 11 = rising/falling bi-direction (Level change trigger).

Example: Setup INT0 interrupt request and bi-direction edge trigger.

```

MOV      A, #03H
B0MOV    PEDGE, A      ; Set INT0 interrupt trigger as bi-direction edge.

B0BSET   FP00IEN      ; Enable INT0 interrupt service
B0BCLR   FP00IRQ      ; Clear INT0 interrupt request flag
B0BSET   FGIE         ; Enable GIE
    
```

Example: INT0 interrupt service routine.

```

                                ORG          8          ; Interrupt vector
INT_SERVICE:                    JMP          INT_SERVICE
                                ...
                                ; Push routine to save ACC and PFLAG to buffers.
                                ...
                                B0BTS1    FP00IRQ    ; Check P00IRQ
                                JMP          EXIT_INT  ; P00IRQ = 0, exit interrupt vector
                                ...
                                B0BCLR    FP00IRQ    ; Reset P00IRQ
                                ...
                                ; INTO interrupt service routine
EXIT_INT:                        ...
                                ; Pop routine to load ACC and PFLAG from buffers.
                                ...
                                RETI         ; Exit interrupt vector
```

6.7 T0 INTERRUPT OPERATION

When the T0C counter occurs overflow, the T0IRQ will be set to "1" however the T0IEN is enable or disable. If the T0IEN = 1, the trigger event will make the T0IRQ to be "1" and the system enter interrupt vector. If the T0IEN = 0, the trigger event will make the T0IRQ to be "1" but the system will not enter interrupt vector. Users need to care for the operation under multi-interrupt situation.

➤ Example: T0 interrupt request setup.

```

B0BCLR    FT0IEN    ; Disable T0 interrupt service
B0BCLR    FT0ENB    ; Disable T0 timer
MOV       A, #20H   ;
B0MOV     T0M, A    ; Set T0 clock = Fcpu / 64
MOV       A, #74H   ; Set T0C initial value = 74H
B0MOV     T0C, A    ; Set T0 interval = 10 ms

B0BSET    FT0IEN    ; Enable T0 interrupt service
B0BCLR    FT0IRQ    ; Clear T0 interrupt request flag
B0BSET    FT0ENB    ; Enable T0 timer

B0BSET    FGIE      ; Enable GIE

```

➤ Example: T0 interrupt service routine.

```

ORG       8          ; Interrupt vector
JMP      INT_SERVICE

INT_SERVICE:

...        ; Push routine to save ACC and PFLAG to buffers.

B0BTS1   FT0IRQ    ; Check T0IRQ
JMP     EXIT_INT  ; T0IRQ = 0, exit interrupt vector

B0BCLR   FT0IRQ    ; Reset T0IRQ
MOV     A, #74H    ; Reset T0C.
B0MOV    T0C, A    ; T0 interrupt service routine
...
...

EXIT_INT:

...        ; Pop routine to load ACC and PFLAG from buffers.

RETI      ; Exit interrupt vector

```

6.8 T1 INTERRUPT OPERATION

When the T1C counter overflows, the T1IRQ will be set to “1” no matter the T1IEN is enable or disable. If the T1IEN and the trigger event T1IRQ is set to be “1”. As the result, the system will execute the interrupt vector. If the T1IEN = 0, the trigger event T1IRQ is still set to be “1”. Moreover, the system won’t execute interrupt vector even when the T1IEN is set to be “1”. Users need to be cautious with the operation under multi-interrupt situation.

➤ **Example: T1 interrupt request setup.**

```

B0BCLR    FT1IEN        ; Disable T1 interrupt service
B0BCLR    FT1ENB        ; Disable T1 timer
MOV       A, #00H       ;
B0MOV     T1M, A        ; Set T1 clock = Fcpu / 256
MOV       A, #0E5H      ; Set T1CL initial value = E5H
B0MOV     T1CL, A
MOV       A, #48H       ; Set T1CH initial value = 48H
B0MOV     T1CH, A       ; Set T1 interval = 1s

B0BSET    FT1IEN        ; Enable T1 interrupt service
B0BCLR    FT1IRQ        ; Clear T1 interrupt request flag
B0BSET    FT1ENB        ; Enable T1 timer

B0BSET    FGIE          ; Enable GIE

```

Example: T1 interrupt service routine.

```

ORG       8              ; Interrupt vector
JMP      INT_SERVICE

INT_SERVICE:

...           ; Push routine to save ACC and PFLAG to buffers.

B0BTS1    FT1IRQ        ; Check T1IRQ
JMP      EXIT_INT      ; T1IRQ = 0, exit interrupt vector

B0BCLR    FT1IRQ        ; Reset T1IRQ
MOV       A, #0E5H      ;
B0MOV     T1CL, A       ; Reset T1CL.
MOV       A, #48H       ;
B0MOV     T1CH, A       ; Reset T1CH.
...           ; T1 interrupt service routine
...

EXIT_INT:

...           ; Pop routine to load ACC and PFLAG from buffers.

RETI      ; Exit interrupt vector

```

6.9 TC0 INTERRUPT OPERATION

When the TC0C counter overflows, the TC0IRQ will be set to "1" no matter the TC0IEN is enable or disable. If the TC0IEN and the trigger event TC0IRQ is set to be "1". As the result, the system will execute the interrupt vector. If the TC0IEN = 0, the trigger event TC0IRQ is still set to be "1". Moreover, the system won't execute interrupt vector even when the TC0IRQ is set to be "1". Users need to be cautious with the operation under multi-interrupt situation.

Example: TC0 interrupt request setup.

```

B0BCLR    FTC0IEN    ; Disable TC0 interrupt service
B0BCLR    FTC0ENB    ; Disable TC0 timer
MOV       A, #20H    ;
B0MOV     TC0M, A    ; Set TC0 clock = Fcpu / 64
MOV       A, #74H    ; Set TC0C initial value = 74H
B0MOV     TC0C, A    ; Set TC0 interval = 10 ms

B0BSET    FTC0IEN    ; Enable TC0 interrupt service
B0BCLR    FTC0IRQ    ; Clear TC0 interrupt request flag
B0BSET    FTC0ENB    ; Enable TC0 timer

B0BSET    FGIE       ; Enable GIE

```

Example: TC0 interrupt service routine.

```

ORG       8          ; Interrupt vector
JMP      INT_SERVICE

INT_SERVICE:

...        ; Push routine to save ACC and PFLAG to buffers.

B0BTS1   FTC0IRQ    ; Check TC0IRQ
JMP     EXIT_INT   ; TC0IRQ = 0, exit interrupt vector

B0BCLR   FTC0IRQ    ; Reset TC0IRQ
MOV     A, #74H    ;
B0MOV   TC0C, A    ; Reset TC0C.
...        ; TC0 interrupt service routine
...

EXIT_INT:

...        ; Pop routine to load ACC and PFLAG from buffers.

RETI     ; Exit interrupt vector

```

6.10 TC1 INTERRUPT OPERATION

When the TC1C counter overflows, the TC1IRQ will be set to "1" no matter the TC1IEN is enable or disable. If the TC1IEN and the trigger event TC1IRQ is set to be "1". As the result, the system will execute the interrupt vector. If the TC1IEN = 0, the trigger event TC1IRQ is still set to be "1". Moreover, the system won't execute interrupt vector even when the TC1IRQ is set to be "1". Users need to be cautious with the operation under multi-interrupt situation.

➤ Example: TC1 interrupt request setup.

```

B0BCLR    FTC1IEN    ; Disable TC1 interrupt service
B0BCLR    FTC1ENB    ; Disable TC1 timer
MOV       A, #20H    ;
B0MOV     TC1M, A    ; Set TC1 clock = Fcpu / 64
MOV       A, #74H    ; Set TC1C initial value = 74H
B0MOV     TC1C, A    ; Set TC1 interval = 10 ms

B0BSET    FTC1IEN    ; Enable TC1 interrupt service
B0BCLR    FTC1IRQ    ; Clear TC1 interrupt request flag
B0BSET    FTC1ENB    ; Enable TC1 timer

B0BSET    FGIE       ; Enable GIE

```

➤ Example: TC1 interrupt service routine.

```

ORG       8          ; Interrupt vector
JMP      INT_SERVICE

INT_SERVICE:

...        ; Push routine to save ACC and PFLAG to buffers.

B0BTS1   FTC1IRQ    ; Check TC1IRQ
JMP      EXIT_INT   ; TC1IRQ = 0, exit interrupt vector

B0BCLR   FTC1IRQ    ; Reset TC1IRQ
MOV      A, #74H    ;
B0MOV    TC1C, A    ; Reset TC1C.
...      ; TC1 interrupt service routine
...

EXIT_INT:

...        ; Pop routine to load ACC and PFLAG from buffers.

RETI     ; Exit interrupt vector

```

6.11 USB INTERRUPT OPERATION

When the USB process finished, the USBIRQ will be set to “1” no matter the USBIEN is enable or disable. If the USBIEN and the trigger event USBIRQ is set to be “1”. As the result, the system will execute the interrupt vector. If the USBIEN = 0, the trigger event USBIRQ is still set to be “1”. Moreover, the system won't execute interrupt vector. Users need to be cautious with the operation under multi-interrupt situation.

➤ Example: USB interrupt request setup.

```

B0BCLR    FUSBIEN    ; Disable USB interrupt service
B0BCLR    FUSBIRQ    ; Clear USB interrupt request flag
B0BSET    FUSBIEN    ; Enable USB interrupt service

...
...
; USB initializes.
; USB operation.

B0BSET    FGIE       ; Enable GIE

```

Example: USB interrupt service routine.

```

ORG      8          ; Interrupt vector
INT_SERVICE:
JMP      INT_SERVICE

PUSH     ; Push routine to save ACC and PFLAG to buffers.

B0BTS1   FUSBIRQ    ; Check USBIRQ
JMP      EXIT_INT   ; USBIRQ = 0, exit interrupt vector

B0BCLR   FUSBIRQ    ; Reset USBIRQ

...
...
; USB interrupt service routine

EXIT_INT:
POP      ; Pop routine to load ACC and PFLAG from buffers.

RETI     ; Exit interrupt vector

```

6.12 WAKEUP INTERRUPT OPERATION

When the I/O port 1 or I/O port 0 wakeup the MCU from the sleep mode, the WAKEIRQ will be set to "1" no matter the WAKEIEN is enable or disable. If the WAKEIEN and the trigger event WAKEIRQ is set to be "1". As the result, the system will execute the interrupt vector. If the WAKEIEN = 0, the trigger event WAKEIRQ is still set to be "1". Moreover, the system won't execute interrupt vector. Users need to be cautious with the operation under multi-interrupt situation.

➤ **Example: WAKE interrupt request setup.**

```

B0BCLR    FWAKEIEN    ; Disable WAKE interrupt service
B0BCLR    FWAKEIRQ    ; Clear WAKE interrupt request flag
B0BSET    FWAKEIEN    ; Enable WAKE interrupt service

...
...
; Pin WAKEUP initialize.
; Pin WAKEUP operation.

B0BSET    FGIE        ; Enable GIE

```

Example: WAKE interrupt service routine.

```

ORG      8            ; Interrupt vector
JMP      INT_SERVICE

INT_SERVICE:

PUSH     ; Push routine to save ACC and PFLAG to buffers.

B0BTS1   FWAKEIRQ    ; Check WAKEIRQ
JMP      EXIT_INT    ; WAKEIRQ = 0, exit interrupt vector

B0BCLR   FWAKEIRQ    ; Reset WAKEIRQ

...
...
; WAKE interrupt service routine

EXIT_INT:

POP      ; Pop routine to load ACC and PFLAG from buffers.

RETI     ; Exit interrupt vector

```

6.13 SIO INTERRUPT OPERATION

When the SIO converting successfully, the SIOIRQ will be set to "1" no matter the SIOIEN is enable or disable. If the SIOIEN and the trigger event SIOIRQ is set to be "1". As the result, the system will execute the interrupt vector. If the SIOIEN = 0, the trigger event SIOIRQ is still set to be "1". Moreover, the system won't execute interrupt vector even when the SIOIEN is set to be "1". Users need to be cautious with the operation under multi-interrupt situation.

➤ **Example: SIO interrupt request setup.**

```

B0BSET      FSIOIEN      ; Enable SIO interrupt service
B0BCLR      FSIOIRQ     ; Clear SIO interrupt request flag
B0BSET      FGIE        ; Enable GIE

```

➤ **Example: SIO interrupt service routine.**

```

INT_SERVICE:
    ORG      8           ; Interrupt vector
    JMP     INT_SERVICE
    ...
    ; Push routine to save ACC and PFLAG to buffers.

    B0BTS1  FSIOIRQ     ; Check SIOIRQ
    JMP     EXIT_INT    ; SIOIRQ = 0, exit interrupt vector

    B0BCLR  FSIOIRQ     ; Reset SIOIRQ
    ...
    ; SIO interrupt service routine

EXIT_INT:
    ...
    ; Pop routine to load ACC and PFLAG from buffers.

    RETI    ; Exit interrupt vector

```

6.14 MULTI-INTERRUPT OPERATION

Under certain condition, the software designer uses more than one interrupt requests. Processing multi-interrupt request requires setting the priority of the interrupt requests. The IRQ flags of interrupts are controlled by the interrupt event. Nevertheless, the IRQ flag "1" doesn't mean the system will execute the interrupt vector. In addition, which means the IRQ flags can be set "1" by the events without enable the interrupt. Once the event occurs, the IRQ will be logic "1". The IRQ and its trigger event relationship is as the below table.

<i>Interrupt Name</i>	<i>Trigger Event Description</i>
P00IRQ	P0.0 trigger controlled by PEDGE
T0IRQ	T0C overflow
T1IRQ	T1C overflow
USBIRQ	USB process finished
WAEKIRQ	I/O port0 & port1 wakeup MCU
SIOIRQ	SIO process finished

For multi-interrupt conditions, two things need to be taking care of. One is to set the priority for these interrupt requests. Two is using IEN and IRQ flags to decide which interrupt to be executed. Users have to check interrupt control bit and interrupt request flag in interrupt routine.

➤ **Example: Check the interrupt request under multi-interrupt operation**

```

        ORG          8          ; Interrupt vector
        JMP          INT_SERVICE

INT_SERVICE:

        ...                ; Push routine to save ACC and PFLAG to buffers.

INTP00CHK:                ; Check INT0 interrupt request
        B0BTS1       FP00IEN  ; Check P00IEN
        JMP          INTT0CHK  ; Jump check to next interrupt
        B0BTS0       FP00IRQ  ; Check P00IRQ
        JMP          INTP00

INTT0CHK:                 ; Check T0 interrupt request
        B0BTS1       FT0IEN   ; Check T0IEN
        JMP          INTT1CHK  ; Jump check to next interrupt
        B0BTS0       FT0IRQ   ; Check T0IRQ
        JMP          INTT0    ; Jump to T0 interrupt service routine
        ; Check T1 interrupt request
INTT1CHK:                 ; Check T1IEN
        B0BTS1       FT1IEN   ; Check T1IEN
        JMP          INTT1CHK  ; Jump check to next interrupt
        B0BTS0       FT1IRQ   ; Check T1IRQ
        JMP          INTT1    ; Jump to T1 interrupt service routine
        ; Check USB interrupt request
INTUSBCHK:                ; Check USBIEN
        B0BTS1       FUSBIEN  ; Check USBIEN
        JMP          INTWAKECHK ; Jump check to next interrupt
        B0BTS0       FUSBIRQ  ; Check USBIRQ
        JMP          INTUSB    ; Jump to USB interrupt service routine
        ; Check USB interrupt request
INTWAKECHK:                ; Check WAKEIEN
        B0BTS1       FWAKEIEN ; Check WAKEIEN
        JMP          INTSIOCHK  ; Jump check to next interrupt
        B0BTS0       FWAKEIRQ ; Check WAKEIRQ
        JMP          INTWAKEUP  ; Jump to WAKEUP interrupt service routine
        ; Check SIO interrupt request
INTSIOCHK:                 ; Check SIOIEN
        B0BTS1       FSIOIEN  ; Check SIOIEN
        JMP          INT_EXIT  ; Jump check to next interrupt
        B0BTS0       FSIOIRQ  ; Check SIOIRQ
        JMP          INTSIO    ; Jump to SIO interrupt service routine

INT_EXIT:

        ...                ; Pop routine to load ACC and PFLAG from buffers.

        RETI              ; Exit interrupt vector

```

7.2 I/O PULL UP REGISTER

0E0H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P0UR	-	-	-	-	P03R	P02R	P01R	P00R

P5	-	-	-	P54	P53	P52	P51	P50
Read/Write	-	-	-	R/W	R/W	R/W	R/W	R/W
After reset	-	-	-	0	0	0	0	0

*** Note:** The P0.4 keeps "1" when external reset enable by code option.

Example: Read data from input port.

```
B0MOV      A, P0           ; Read data from Port 0
B0MOV      A, P1           ; Read data from Port 1
B0MOV      A, P5           ; Read data from Port 5
```

Example: Write data to output port.

```
MOV        A, #0FFH       ; Write data FFH to all Port.
B0MOV      P0, A
B0MOV      P1, A
B0MOV      P5, A
```

Example: Write one bit data to output port.

```
B0BSET     P1.3           ; Set P1.3 and P5.3 to be "1".
B0BSET     P5.3

B0BCLR     P1.3           ; Set P1.3 and P5.3 to be "0".
B0BCLR     P5.3
```

7.4 I/O PORT1 WAKEUP CONTROL REGISTER

0C0H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P1W	P17W	P16W	P15W	P14W	P13W	P12W	P11W	P10W
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

Bit [7:0] **P1nW**: Port 1 wakeup function control bit.
 0 = Disable port 1 wakeup function.
 1 = Enable port 1 wakeup function.

8 TIMERS

8.1 WATCHDOG TIMER

The watchdog timer (WDT) is a binary up counter designed for monitoring program execution. If the program goes into the unknown status by noise interference, WDT overflow signal raises and resets MCU. Watchdog clock controlled by code option and the clock source is internal low-speed oscillator (24KHz).

Watchdog overflow time = 8192 / Internal Low-Speed oscillator (sec).

VDD	Internal Low RC Freq.	Watchdog Overflow Time
5V	24KHz	341ms

* **Note: If watchdog is "Always_On" mode, it keeps running event under power down mode or green mode.**

Watchdog clear is controlled by WDTR register. Moving **0x5A** data into WDTR is to reset watchdog timer.

OCCH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
WDTR	WDTR7	WDTR6	WDTR5	WDTR4	WDTR3	WDTR2	WDTR1	WDTR0
Read/Write	W	W	W	W	W	W	W	W
After reset	0	0	0	0	0	0	0	0

Example: An operation of watchdog timer is as following. To clear the watchdog timer counter in the top of the main routine of the program.

```
Main:
      MOV      A,#5AH      ; Clear the watchdog timer.
      B0MOV   WDTR,A
      ...
      CALL    SUB1
      CALL    SUB2
      ...
      ...
      JMP     MAIN
```

Watchdog timer application note is as following.

- Before clearing watchdog timer, check I/O status and check RAM contents can improve system error.
 - Don't clear watchdog timer in interrupt vector and interrupt service routine. That can improve main routine fail.
 - Clearing watchdog timer program is only at one part of the program. This way is the best structure to enhance the watchdog timer function.
- **Example: An operation of watchdog timer is as following. To clear the watchdog timer counter in the top of the main routine of the program.**

Main:

...

; Check I/O.

...

; Check RAM

Err: JMP \$

; I/O or RAM error. Program jump here and don't
; clear watchdog. Wait watchdog timer overflow to reset IC.

Correct:

; I/O and RAM are correct. Clear watchdog timer and
; execute program.

```

MOV          A,#5AH
B0MOV       WDTR,A
CALL        SUB1
CALL        SUB2
...
...
...
JMP        MAIN

```

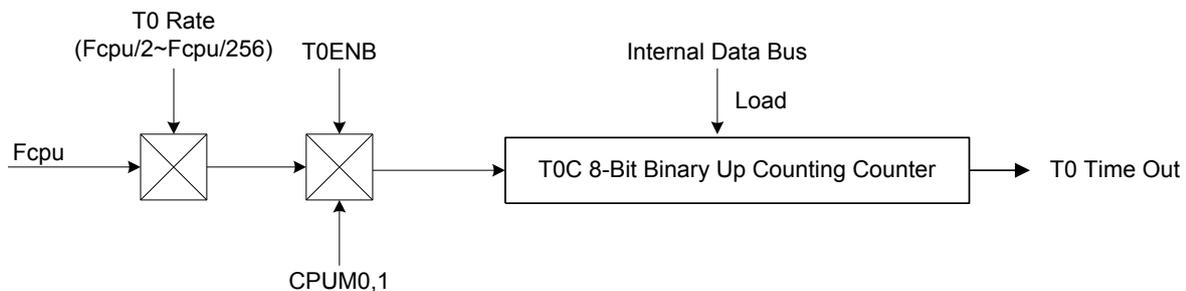

8.2 TIMER 0 (T0)

8.2.1 OVERVIEW

The T0 is an 8-bit binary up timer and event counter. If T0 timer occurs an overflow (from FFH to 00H), it will continue counting and issue a time-out signal to trigger T0 interrupt to request interrupt service.

The main purpose of the T0 timer is as following.

- ☞ **8-bit programmable up counting timer:** Generates interrupts at specific time intervals based on the selected clock frequency.
- ☞ **Green mode wakeup function:** T0 can be green mode wake-up time as T0ENB = 1. System will be wake-up by T0 time out.

8.2.2 T0M MODE REGISTER

0D8H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
T0M	T0ENB	T0rate2	T0rate1	T0rate0	-	-	-	
Read/Write	R/W	R/W	R/W	R/W	-	-	-	
After reset	0	0	0	0	-	-	-	

Bit 7 **T0ENB:** T0 counter control bit.
0 = Disable T0 timer.
1 = Enable T0 timer.

Bit [6:4] **T0RATE[2:0]:** T0 internal clock select bits.
000 = fcpu/256.
001 = fcpu/128.
...
110 = fcpu/4.
111 = fcpu/2.

8.2.3 T0C COUNTING REGISTER

T0C is an 8-bit counter register for T0 interval time control.

0D9H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
T0C	T0C7	T0C6	T0C5	T0C4	T0C3	T0C2	T0C1	T0C0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

The equation of T0C initial value is as following.

$T0C\ initial\ value = 256 - (T0\ interrupt\ interval\ time * input\ clock)$
--

Example: To set 1ms interval time for T0 interrupt. High clock is 12MHz. Fcpu=Fosc/2. Select TORATE=010 (Fcpu/64).

$$\begin{aligned}
 T0C\ initial\ value &= 256 - (T0\ interrupt\ interval\ time * input\ clock) \\
 &= 256 - (1ms * 6MHz / 1 / 64) \\
 &= 256 - (10^{-3} * 6 * 10^6 / 1 / 64) \\
 &= 162 \\
 &= A2H
 \end{aligned}$$

The basic timer table interval time of T0.

TORATE	T0CLOCK	High speed mode (Fcpu = 12MHz / 2)	
		Max overflow interval	One step = max/256
000	Fcpu/256	10.923 ms	42.67 us
001	Fcpu/128	5.461 ms	21.33 us
010	Fcpu/64	2.731 ms	10.67 us
011	Fcpu/32	1.365 ms	5.33 us
100	Fcpu/16	0.683 ms	2.67 us
101	Fcpu/8	0.341 ms	1.33 us
110	Fcpu/4	0.171 ms	0.67 us
111	Fcpu/2	0.085 ms	0.33 us

8.2.4 T0 TIMER OPERATION SEQUENCE

T0 timer operation sequence of setup T0 timer is as following.

☞ **Stop T0 timer counting, disable T0 interrupt function and clear T0 interrupt request flag.**

```

B0BCLR    FT0ENB    ; T0 timer.
B0BCLR    FT0IEN    ; T0 interrupt function is disabled.
B0BCLR    FT0IRQ    ; T0 interrupt request flag is cleared.

```

☞ **Set T0 timer rate.**

```

MOV       A, #0xx0000b ;The T0 rate control bits exist in bit4~bit6 of TOM. The
B0MOV     TOM,A        ; value is from x000xxxxb~x111xxxxb.
           ; T0 timer is disabled.

```

☞ **Set T0 interrupt interval time.**

```

MOV       A,#7FH
B0MOV     T0C,A        ; Set T0C value.

```

☞ **Set T0 timer function mode.**

```

B0BSET    FT0IEN    ; Enable T0 interrupt function.

```

☞ **Enable T0 timer.**

```

B0BSET    FT0ENB    ; Enable T0 timer.

```

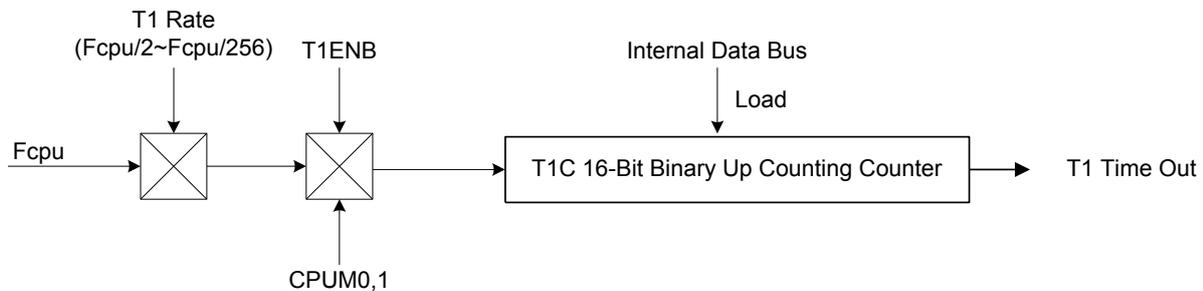

8.3 TIMER T1 (T1)

8.3.1 OVERVIEW

The T1 is a 16-bit binary up timer and event counter. If T1 timer occurs an overflow (from FFFFH to 0000H), it will continue counting and issue a time-out signal to trigger T1 interrupt to request interrupt service.

The main purpose of the T1 timer is as following.

- ☞ **16-bit programmable up counting timer:** Generates interrupts at specific time intervals based on the selected clock frequency.
- ☞ **Green mode wakeup function:** T1 can be green mode wake-up time as T1ENB = 1. System will be wake-up by T1 time out.

8.3.2 T1M MODE REGISTER

0DAH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
T1M	T1ENB	T1rate2	T1rate1	T1rate0	-	-	-	
Read/Write	R/W	R/W	R/W	R/W	-	-	-	
After reset	0	0	0	0	-	-	-	

Bit 7 **T1ENB:** T1 counter control bit.
0 = Disable T1 timer.
1 = Enable T1 timer.

Bit [6:4] **T1RATE[2:0]:** T1 internal clock select bits.
000 = fcpu/256.
001 = fcpu/128.
...
110 = fcpu/4.
111 = fcpu/2.

8.3.3 T1C COUNTING REGISTER

T1CL with T1CH is an 16-bit counter register for T1 interval time control.

0DBH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
T1CL	T1C7	T1C6	T1C5	T1C4	T1C3	T1C2	T1C1	T1C0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

0DCH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
T1CH	T1C15	T1C14	T1C13	T1C12	T1C11	T1C10	T1C9	T1C8
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

The equation of T1C initial value is as following.

$$T1C \text{ initial value} = 65536 - (T1 \text{ interrupt interval time} * \text{input clock})$$

Example: To set 1ms interval time for T1 interrupt. High clock is 12MHz. Fcpu=Fosc/2. Select T1RATE=001 (Fcpu/128).

$$\begin{aligned}
 T1C \text{ initial value} &= 65536 - (T1 \text{ interrupt interval time} * \text{input clock}) \\
 &= 65536 - (1s * 12MHz / 2 / 128) \\
 &= 65536 - (10 * 6 * 10^6 / 1 / 128) \\
 &= 18661 \\
 &= 48E5H
 \end{aligned}$$

The basic timer table interval time of T1.

T1RATE	T1CLOCK	High speed mode (Fcpu = 12MHz / 2)	
		Max overflow interval	One step = max/256
000	Fcpu/256	2.796 s	42.67 us
001	Fcpu/128	1.398 s	21.33 us
010	Fcpu/64	699.051 ms	10.67 us
011	Fcpu/32	349.525 ms	5.33 us
100	Fcpu/16	174.763 ms	2.67 us
101	Fcpu/8	87.381 ms	1.33 us
110	Fcpu/4	43.691 ms	0.67 us
111	Fcpu/2	21.845 ms	0.33 us

8.3.4 T1 TIMER OPERATION SEQUENCE

T1 timer operation sequence of setup T1 timer is as following.

☞ **Stop T1 timer counting, disable T1 interrupt function and clear T1 interrupt request flag.**

```

B0BCLR      FT1ENB      ; T1 timer.
B0BCLR      FT1IEN     ; T1 interrupt function is disabled.
B0BCLR      FT1IRQ     ; T1 interrupt request flag is cleared.
    
```

☞ **Set T1 timer rate.**

MOV	A, #0xxx0000b	;The T1 rate control bits exist in bit4~bit6 of T1M. The
B0MOV	T1M,A	; value is from x000xxxxb~x111xxxxb.
		; T1 timer is disabled.

☞ **Set T1 interrupt interval time.**

MOV	A,#0E5H	
B0MOV	T1CL,A	; Set T1CL value.
MOV	A,#48H	
B0MOV	T1CH,A	; Set T1CH value.

☞ **Set T1 timer function mode.**

B0BSET	FT1IEN	; Enable T1 interrupt function.
--------	--------	---------------------------------

☞ **Enable T1 timer.**

B0BSET	FT1ENB	; Enable T1 timer.
--------	--------	--------------------

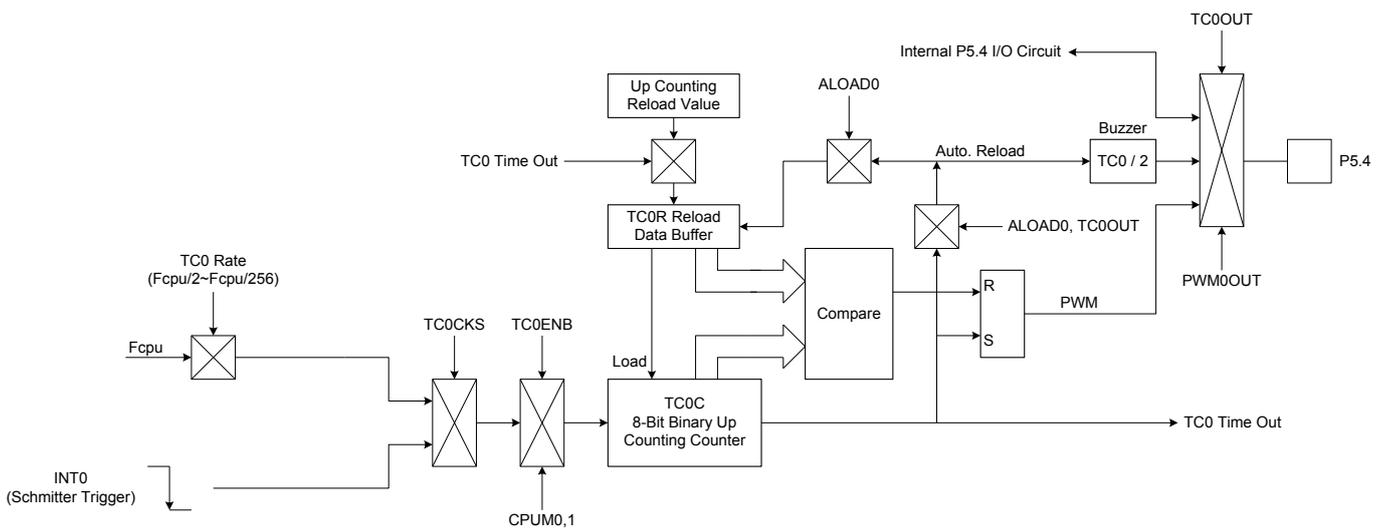

8.4 TIMER/COUNTER 0 (TC0)

8.4.1 OVERVIEW

The TC0 is an 8-bit binary up counting timer with double buffers. TC0 has two clock sources including internal clock and external clock for counting a precision time. The internal clock source is from Fcpu. The external clock is INT0 from P0.0 pin (Falling edge trigger). Using TC0M register selects TC0C's clock source from internal or external. If TC0 timer occurs an overflow, it will continue counting and issue a time-out signal to trigger TC0 interrupt to request interrupt service. TC0 overflow time is 0xFF to 0X00 normally. Under PWM mode, TC0 overflow is decided by PWM cycle controlled by ALOAD0 and TC0OUT bits.

The main purposes of the TC0 timer is as following.

- ☞ **8-bit programmable up counting timer:** Generates interrupts at specific time intervals based on the selected clock frequency.
- ☞ **External event counter:** Counts system “events” based on falling edge detection of external clock signals at the INT0 input pin.
- ☞ **Buzzer output**
- ☞ **PWM output**

8.4.2 TC0M MODE REGISTER

088H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC0M	TC0ENB	TC0rate2	TC0rate1	TC0rate0	TC0CKS	ALOAD0	TC0OUT	PWM0OUT
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

- Bit 0 **PWM0OUT:** PWM output control bit.
0 = Disable PWM output.
1 = Enable PWM output. PWM duty controlled by TC0OUT, ALOAD0 bits.
- Bit 1 **TC0OUT:** TC0 time out toggle signal output control bit. **Only valid when PWM0OUT = 0.**
0 = Disable, P5.4 is I/O function.
1 = Enable, P5.4 is output TC0OUT signal.
- Bit 2 **ALOAD0:** Auto-reload control bit. **Only valid when PWM0OUT = 0.**
0 = Disable TC0 auto-reload function.
1 = Enable TC0 auto-reload function.
- Bit 3 **TC0CKS:** TC0 clock source select bit.
0 = Internal clock (Fcpu or Fosc).
1 = External clock from P0.0/INT0 pin.
- Bit [6:4] **TC0RATE[2:0]:** TC0 internal clock select bits.
000 = fcpu/256.
001 = fcpu/128.
...
110 = fcpu/4.
111 = fcpu/2.
- Bit 7 **TC0ENB:** TC0 counter control bit.
0 = Disable TC0 timer.
1 = Enable TC0 timer.

* **Note:** When TC0CKS=1, TC0 became an external event counter and TC0RATE is useless. No more P0.0 interrupt request will be raised. (P0.0IRQ will be always 0).

8.4.3 TC0C COUNTING REGISTER

TC0C is an 8-bit counter register for TC0 interval time control.

089H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC0C	TC0C7	TC0C6	TC0C5	TC0C4	TC0C3	TC0C2	TC0C1	TC0C0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

The equation of TC0C initial value is as following.

$$TC0C \text{ initial value} = N - (TC0 \text{ interrupt interval time} * \text{input clock})$$

N is TC0 overflow boundary number. TC0 timer overflow time has six types (TC0 timer, TC0 event counter, TC0 Fcpu clock source, TC0 Fosc clock source, PWM mode and no PWM mode). These parameters decide TC0 overflow time and valid value as follow table.

TC0CKS	PWM0	ALOAD0	TC0OUT	N	TC0C valid value	TC0C value binary type	Remark
0	0	x	x	256	0x00~0xFF	00000000b~11111111b	Overflow per 256 count
	1	0	0	256	0x00~0xFF	00000000b~11111111b	Overflow per 256 count
	1	0	1	64	0x00~0x3F	xx000000b~xx111111b	Overflow per 64 count
	1	1	0	32	0x00~0x1F	xxx00000b~xxx11111b	Overflow per 32 count
	1	1	1	16	0x00~0x0F	xxxx0000b~xxxx1111b	Overflow per 16 count
1	-	-	-	256	0x00~0xFF	00000000b~11111111b	Overflow per 256 count

Example: To set 1ms interval time for TC0 interrupt. TC0 clock source is Fcpu (TC0KS=0) and no PWM output (PWM0=0). High clock is internal 6MHz. Fcpu=Fosc/1. Select TC0RATE=010 (Fcpu/64).

$$\begin{aligned}
 TC0C \text{ initial value} &= N - (TC0 \text{ interrupt interval time} * \text{input clock}) \\
 &= 256 - (1\text{ms} * 6\text{MHz} / 1 / 64) \\
 &= 256 - (10^{-3} * 6 * 10^6 / 1 / 64) \\
 &= 162 \\
 &= A2H
 \end{aligned}$$

The basic timer table interval time of TC0.

TC0RATE	TC0CLOCK	High speed mode (Fcpu = 6MHz / 1)	
		Max overflow interval	One step = max/256
000	Fcpu/256	10.923 ms	42.67 us
001	Fcpu/128	5.461 ms	21.33 us
010	Fcpu/64	2.731 ms	10.67 us
011	Fcpu/32	1.365 ms	5.33 us
100	Fcpu/16	0.683 ms	2.67 us
101	Fcpu/8	0.341 ms	1.33 us
110	Fcpu/4	0.171 ms	0.67 us
111	Fcpu/2	0.085 ms	0.33 us

8.4.4 TC0R AUTO-LOAD REGISTER

TC0 timer is with auto-load function controlled by ALOAD0 bit of TC0M. When TC0C overflow occurring, TC0R value will load to TC0C by system. It is easy to generate an accurate time, and users don't reset TC0C during interrupt service routine.

TC0 is double buffer design. If new TC0R value is set by program, the new value is stored in 1st buffer. Until TC0 overflow occurs, the new value moves to real TC0R buffer. This way can avoid TC0 interval time error and glitch in PWM and Buzzer output.

* **Note: Under PWM mode, auto-load is enabled automatically. The ALOAD0 bit is selecting overflow boundary.**

08AH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC0R	TC0R7	TC0R6	TC0R5	TC0R4	TC0R3	TC0R2	TC0R1	TC0R0
Read/Write	W	W	W	W	W	W	W	W
After reset	0	0	0	0	0	0	0	0

The equation of TC0R initial value is as following.

$$TC0R \text{ initial value} = N - (TC0 \text{ interrupt interval time} * \text{input clock})$$

N is TC0 overflow boundary number. TC0 timer overflow time has six types (TC0 timer, TC0 event counter, TC0 Fcpu clock source, TC0 Fosc clock source, PWM mode and no PWM mode). These parameters decide TC0 overflow time and valid value as follow table.

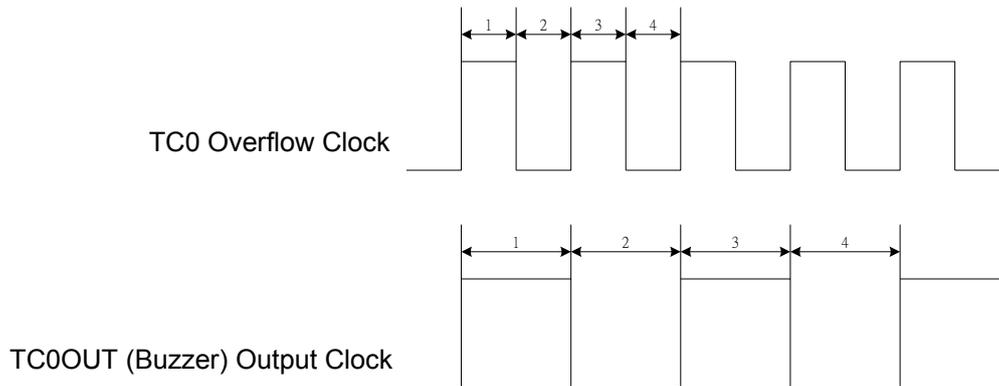

TC0CKS	PWM0	ALOAD0	TC0OUT	N	TC0R valid value	TC0R value binary type
0	0	x	x	256	0x00~0xFF	00000000b~11111111b
	1	0	0	256	0x00~0xFF	00000000b~11111111b
	1	0	1	64	0x00~0x3F	xx000000b~xx111111b
	1	1	0	32	0x00~0x1F	xxx00000b~xxx11111b
	1	1	1	16	0x00~0x0F	xxxx0000b~xxxx1111b
1	-	-	-	256	0x00~0xFF	00000000b~11111111b

Example: To set 1ms interval time for TC0 interrupt. TC0 clock source is Fcpu (TC0KS=0) and no PWM output (PWM0=0). High clock is internal 6MHz. Fcpu=Fosc/1. Select TC0RATE=010 (Fcpu/64).

$$\begin{aligned}
 TC0R \text{ initial value} &= N - (TC0 \text{ interrupt interval time} * \text{input clock}) \\
 &= 256 - (1ms * 6MHz / 1 / 64) \\
 &= 256 - (10^{-3} * 6 * 10^6 / 1 / 64) \\
 &= 162 \\
 &= A2H
 \end{aligned}$$

8.4.5 TC0 CLOCK FREQUENCY OUTPUT (BUZZER)

Buzzer output (TC0OUT) is from TC0 timer/counter frequency output function. By setting the TC0 clock frequency, the clock signal is output to P5.4 and the P5.4 general purpose I/O function is auto-disable. The TC0OUT frequency is divided by 2 from TC0 interval time. TC0OUT frequency is 1/2 TC0 frequency. The TC0 clock has many combinations and easily to make difference frequency. The TC0OUT frequency waveform is as following.

Example: Setup TC0OUT output from TC0 to TC0OUT (P5.4). The external high-speed clock is 4MHz. The TC0OUT frequency is 0.5KHz. Because the TC0OUT signal is divided by 2, set the TC0 clock to 1KHz. The TC0 clock source is from external oscillator clock. T0C rate is $F_{cpu}/4$. The $TC0RATE2 \sim TC0RATE1 = 110$. $TC0C = TC0R = 131$.

```

MOV      A,#01100000B
B0MOV    TC0M,A          ; Set the TC0 rate to Fcpu/4

MOV      A,#131
B0MOV    TC0C,A          ; Set the auto-reload reference value
B0MOV    TC0R,A

B0BSET   FTC0OUT         ; Enable TC0 output to P5.4 and disable P5.4 I/O function
B0BSET   FALOAD1        ; Enable TC0 auto-reload function
B0BSET   FTC0ENB        ; Enable TC0 timer

```

* **Note: Buzzer output is enable, and "PWM0OUT" must be "0".**

8.4.6 TC0 TIMER OPERATION SEQUENCE

TC0 timer operation includes timer interrupt, event counter, TC0OUT and PWM. The sequence of setup TC0 timer is as following.

☞ Stop TC0 timer counting, disable TC0 interrupt function and clear TC0 interrupt request flag.

```

☞          B0BCLR      FTC0ENB      ; TC0 timer, TC0OUT and PWM stop.
          B0BCLR      FTC0IEN      ; TC0 interrupt function is disabled.
          B0BCLR      FTC0IRQ      ; TC0 interrupt request flag is cleared.

```

☞ Set TC0 timer rate. (Besides event counter mode.)

```

          MOV          A, #0xxx0000b ;The TC0 rate control bits exist in bit4~bit6 of TC0M. The
          B0MOV       TC0M,A        ; value is from x000xxxxb~x111xxxxb.
          ; TC0 interrupt function is disabled.

```

☞ Set TC0 timer clock source.

; Select TC0 internal / external clock source.

```

          B0BCLR      FTC0CKS      ; Select TC0 internal clock source.

```

or

```

          B0BSET      FTC0CKS      ; Select TC0 external clock source.

```

☞ Set TC0 timer auto-load mode.

```

          B0BCLR      FALOAD0      ; Enable TC0 auto reload function.

```

or

```

          B0BSET      FALOAD0      ; Disable TC0 auto reload function.

```

☞ Set TC0 interrupt interval time, TC0OUT (Buzzer) frequency or PWM duty cycle.

; Set TC0 interrupt interval time, TC0OUT (Buzzer) frequency or PWM duty.

```

          MOV          A, #7FH      ; TC0C and TC0R value is decided by TC0 mode.
          B0MOV       TC0C,A        ; Set TC0C value.
          B0MOV       TC0R,A        ; Set TC0R value under auto reload mode or PWM mode.

```

; In PWM mode, set PWM cycle.

```

          B0BCLR      FALOAD0      ; ALOAD0, TC0OUT = 00, PWM cycle boundary is
          B0BCLR      FTC0OUT      ; 0~255.

```

or

```

          B0BCLR      FALOAD0      ; ALOAD0, TC0OUT = 01, PWM cycle boundary is
          B0BSET      FTC0OUT      ; 0~63.

```

or

```

          B0BSET      FALOAD0      ; ALOAD0, TC0OUT = 10, PWM cycle boundary is
          B0BCLR      FTC0OUT      ; 0~31.

```

or

```

          B0BSET      FALOAD0      ; ALOAD0, TC0OUT = 11, PWM cycle boundary is
          B0BSET      FTC0OUT      ; 0~15.

```

☞ Set TC0 timer function mode.

```

          B0BSET      FTC0IEN      ; Enable TC0 interrupt function.

```

or

```

          B0BSET      FTC0OUT      ; Enable TC0OUT (Buzzer) function.

```

or

```

          B0BSET      FPWM0OUT     ; Enable PWM function.

```

☞ Enable TC0 timer.

```

          B0BSET      FTC0ENB      ; Enable TC0 timer.

```

8.5 PWM0 MODE

8.5.1 OVERVIEW

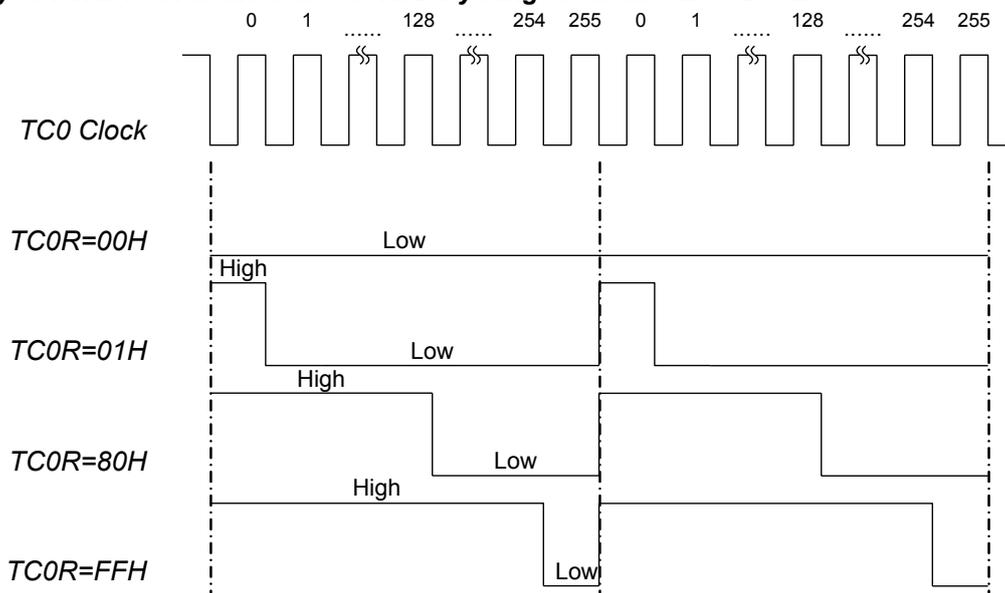

PWM function is generated by TC0 timer counter and output the PWM signal to PWM0OUT pin (P5.4). The 8-bit counter counts modulus 256, 64, 32, 16 controlled by ALOAD0, TC0OUT bits. The value of the 8-bit counter (TC0C) is compared to the contents of the reference register (TC0R). When the reference register value (TC0R) is equal to the counter value (TC0C), the PWM output goes low. When the counter reaches zero, the PWM output is forced high. The low-to-high ratio (duty) of the PWM0 output is TC0R/256, 64, 32, 16.

PWM output can be held at low level by continuously loading the reference register with 00H. Under PWM operating, to change the PWM's duty cycle is to modify the TC0R.

* **Note: TC0 is double buffer design. Modifying TC0R to change PWM duty by program, there is no glitch and error duty signal in PWM output waveform. Users can change TC0R any time, and the new reload value is loaded to TC0R buffer at TC0 overflow.**

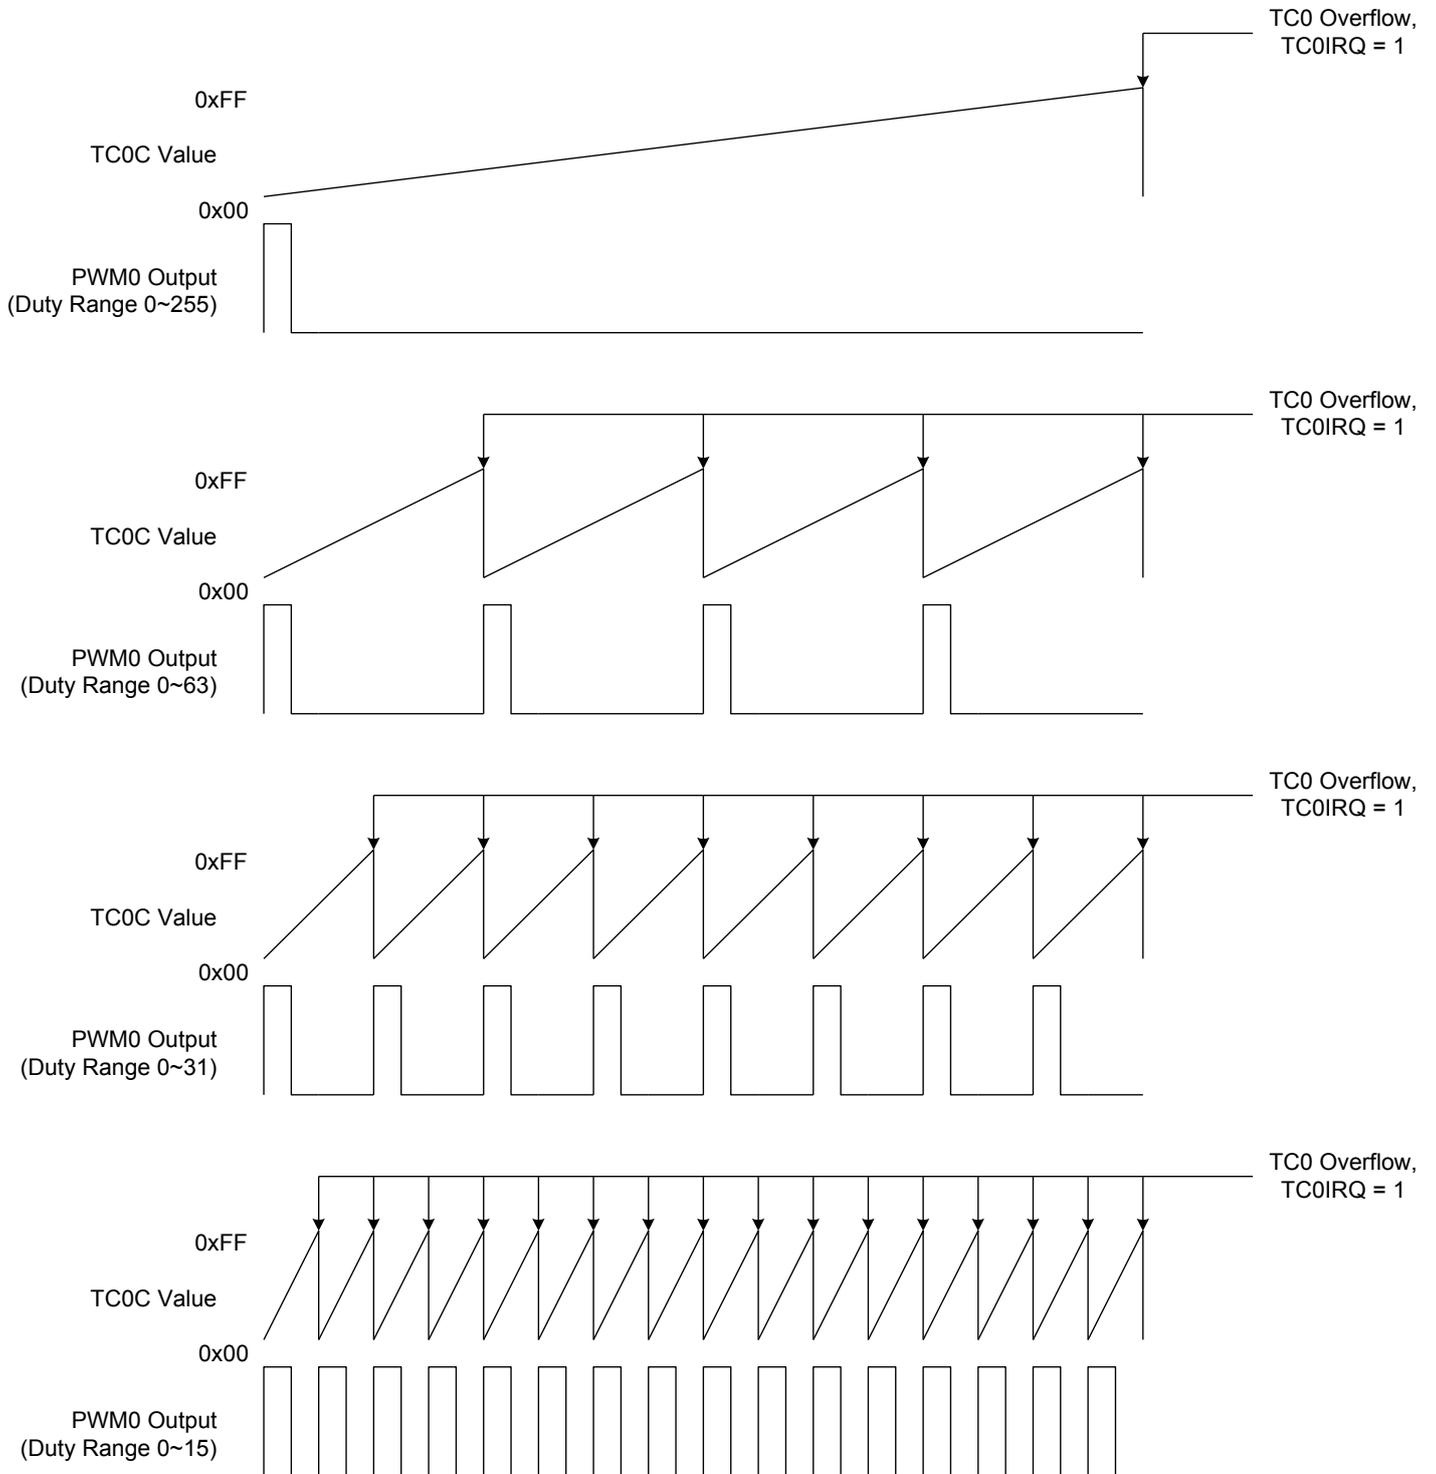

ALOAD0	TC0OUT	PWM duty range	TC0C valid value	TC0R valid bits value	MAX. PWM Frequency (Fcpu = 6MHz)	Remark
0	0	0/256~255/256	0x00~0xFF	0x00~0xFF	11.719K	Overflow per 256 count
0	1	0/64~63/64	0x00~0x3F	0x00~0x3F	46.875K	Overflow per 64 count
1	0	0/32~31/32	0x00~0x1F	0x00~0x1F	93.75K	Overflow per 32 count
1	1	0/16~15/16	0x00~0x0F	0x00~0x0F	187.5K	Overflow per 16 count

The Output duty of PWM is with different TC0R. Duty range is from 0/256~255/256.

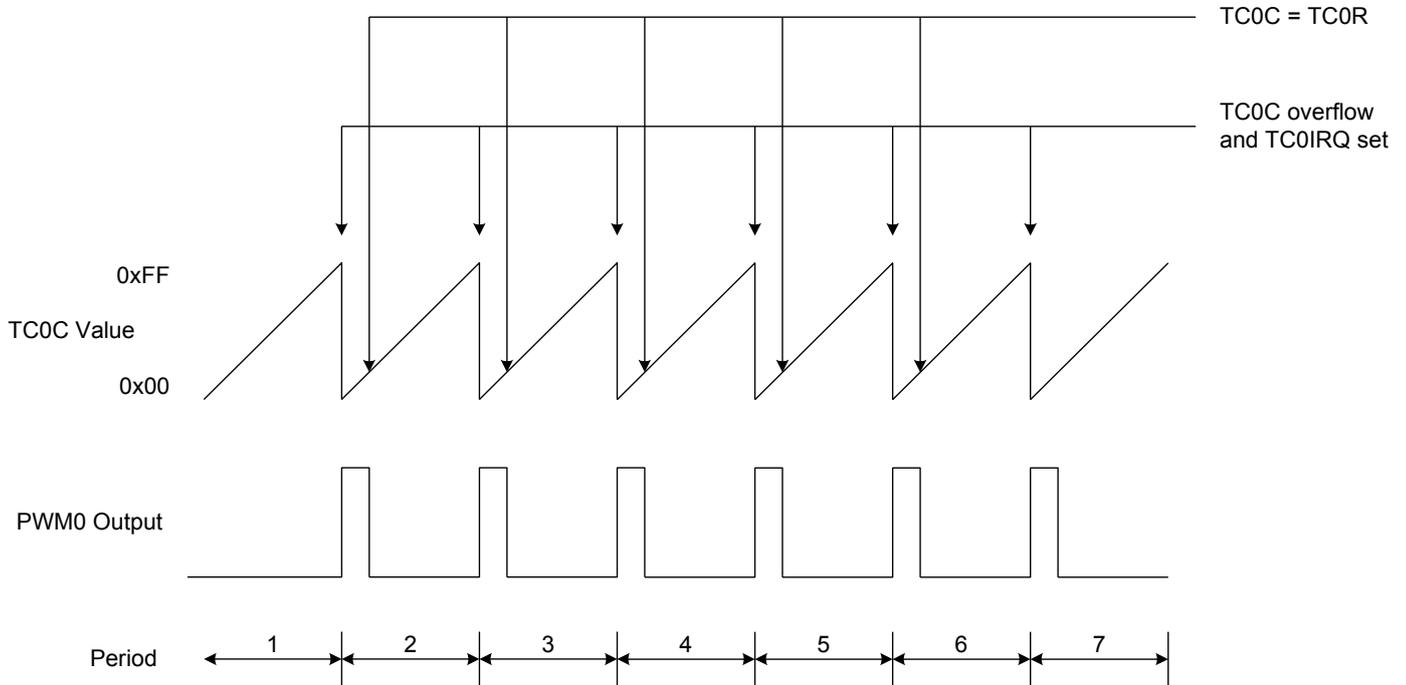

8.5.2 TCxIRQ and PWM Duty

In PWM mode, the frequency of TC0IRQ is depended on PWM duty range. From following diagram, the TC0IRQ frequency is related with PWM duty.

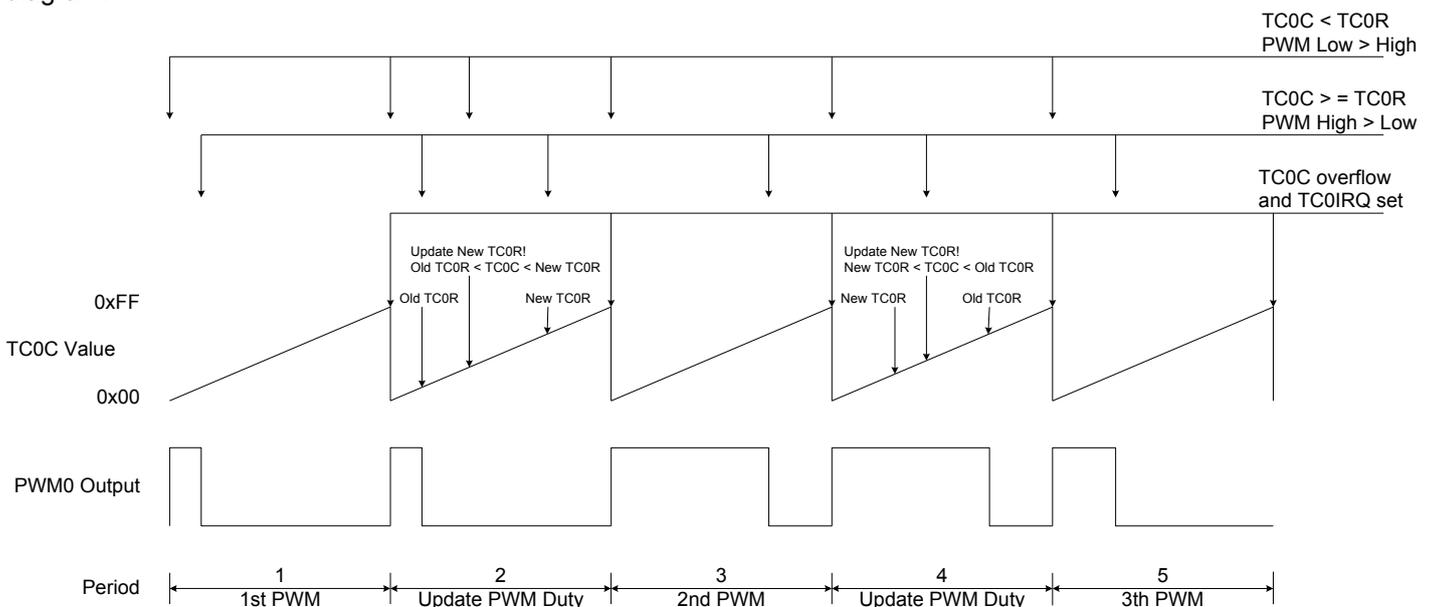

8.5.3 PWM Duty with TCxR Changing

In PWM mode, the system will compare TC0C and TC0R all the time. When $TC0C < TC0R$, the PWM will output logic "High", when $TC0C \geq TC0R$, the PWM will output logic "Low". If TC0C is changed in certain period, the PWM duty will change in next PWM period. If TC0R is fixed all the time, the PWM waveform is also the same.

Above diagram is shown the waveform with fixed TC0R. In every TC0C overflow PWM output "High, when $TC0C \geq TC0R$ PWM output "Low". If TC0R is changing in the program processing, the PWM waveform will become as following diagram.

In period 2 and period 4, new Duty (TC0R) is set. TC0 is double buffer design. The PWM still keeps the same duty in period 2 and period 4, and the new duty is changed in next period. By the way, system can avoid the PWM not changing or H/L changing twice in the same cycle and will prevent the unexpected or error operation.

8.5.4 PWM PROGRAM EXAMPLE

Example: Setup PWM0 output from TC0 to PWM0OUT (P5.4). The clock source is internal 6MHz. $F_{cpu} = F_{osc}/1$. The duty of PWM is 30/256. The PWM frequency is about 6KHz. The PWM clock source is from external oscillator clock. TC0 rate is $F_{cpu}/4$. The $TC0RATE2\sim TC0RATE1 = 110$. $TC0C = TC0R = 30$.

```

MOV      A,#01100000B
B0MOV   TC0M,A           ; Set the TC0 rate to Fcpu/4

MOV      A,#30
B0MOV   TC0C,A           ; Set the PWM duty to 30/256
B0MOV   TC0R,A

B0BCLR  FTC0OUT           ; Set duty range as 0/256~255/256.
B0BCLR  FALOAD0
B0BSET  FPWM0OUT          ; Enable PWM0 output to P5.4 and disable P5.4 I/O function
B0BSET  FTC0ENB           ; Enable TC0 timer

```

* **Note:** The TC0R is write-only register. Don't process them using INCMS, DECMS instructions.

Example: Modify TC0R registers' value.

```

MOV      A, #30H
B0MOV   TC0R, A           ; Input a number using B0MOV instruction.

INCMS   BUF0              ; Get the new TC0R value from the BUF0 buffer defined by
NOP                                           ; programming.
B0MOV   A, BUF0
B0MOV   TC0R, A

```

* **Note:** The PWM can work with interrupt request.

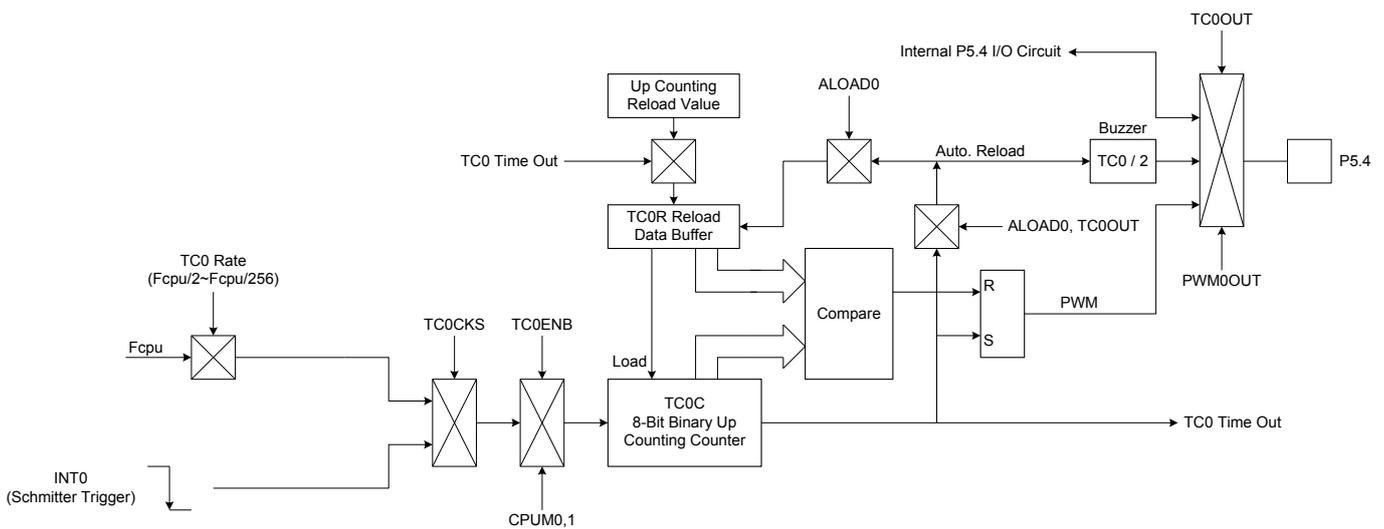

8.6 TIMER/COUNTER 1 (TC1)

8.6.1 OVERVIEW

The TC1 is an 8-bit binary up counting timer with double buffers. TC1 has two clock sources including internal clock and external clock for counting a precision time. The internal clock source is from Fcpu. The external clock is INT0 from P0.0 pin (Falling edge trigger). Using TC1M register selects TC1C's clock source from internal or external. If TC1 timer occurs an overflow, it will continue counting and issue a time-out signal to trigger TC1 interrupt to request interrupt service. TC1 overflow time is 0xFF to 0X00 normally. Under PWM mode, TC1 overflow is decided by PWM cycle controlled by ALOAD0 and TC1OUT bits.

The main purposes of the TC1 timer is as following.

- ☞ **8-bit programmable up counting timer:** Generates interrupts at specific time intervals based on the selected clock frequency.
- ☞ **External event counter:** Counts system “events” based on falling edge detection of external clock signals at the INT0 input pin.
- ☞ **Buzzer output**
- ☞ **PWM output**

0 = Disable TC1 timer.
1 = Enable TC1 timer.

* **Note: When TC1CKS=1, TC1 became an external event counter and TC1RATE is useless. No more P0.0 interrupt request will be raised. (P0.0IRQ will be always 0).**

8.6.3 TC1C COUNTING REGISTER

TC1C is an 8-bit counter register for TC1 interval time control.

08CH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC1C	TC1C7	TC1C6	TC1C5	TC1C4	TC1C3	TC1C2	TC1C1	TC1C0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

The equation of TC1C initial value is as following.

$$TC1C \text{ initial value} = N - (TC1 \text{ interrupt interval time} * \text{input clock})$$

N is TC1 overflow boundary number. TC1 timer overflow time has six types (TC1 timer, TC1 event counter, TC1 Fcpu clock source, TC1 Fosc clock source, PWM mode and no PWM mode). These parameters decide TC1 overflow time and valid value as follow table.

TC1CKS	PWM0	ALOAD0	TC1OUT	N	TC1C valid value	TC1C value binary type	Remark
0	0	x	x	256	0x00~0xFF	00000000b~11111111b	Overflow per 256 count
	1	0	0	256	0x00~0xFF	00000000b~11111111b	Overflow per 256 count
	1	0	1	64	0x00~0x3F	xx000000b~xx111111b	Overflow per 64 count
	1	1	0	32	0x00~0x1F	xxx00000b~xxx11111b	Overflow per 32 count
	1	1	1	16	0x00~0x0F	xxxx0000b~xxxx1111b	Overflow per 16 count
1	-	-	-	256	0x00~0xFF	00000000b~11111111b	Overflow per 256 count

Example: To set 1ms interval time for TC1 interrupt. TC1 clock source is Fcpu (TC1KS=0) and no PWM output (PWM0=0). High clock is internal 6MHz. Fcpu=Fosc/1. Select TC1RATE=010 (Fcpu/64).

$$\begin{aligned}
 TC1C \text{ initial value} &= N - (TC1 \text{ interrupt interval time} * \text{input clock}) \\
 &= 256 - (1\text{ms} * 6\text{MHz} / 1 / 64) \\
 &= 256 - (10^{-3} * 6 * 10^6 / 1 / 64) \\
 &= 162 \\
 &= A2H
 \end{aligned}$$

The basic timer table interval time of TC1.

TC1RATE	TC1CLOCK	High speed mode (Fcpu = 6MHz / 1)	
		Max overflow interval	One step = max/256
000	Fcpu/256	10.923 ms	42.67 us
001	Fcpu/128	5.461 ms	21.33 us
010	Fcpu/64	2.731 ms	10.67 us
011	Fcpu/32	1.365 ms	5.33 us
100	Fcpu/16	0.683 ms	2.67 us
101	Fcpu/8	0.341 ms	1.33 us
110	Fcpu/4	0.171 ms	0.67 us
111	Fcpu/2	0.085 ms	0.33 us

8.6.4 TC1R AUTO-LOAD REGISTER

TC1 timer is with auto-load function controlled by ALOAD0 bit of TC1M. When TC1C overflow occurring, TC1R value will load to TC1C by system. It is easy to generate an accurate time, and users don't reset TC1C during interrupt service routine.

TC1 is double buffer design. If new TC1R value is set by program, the new value is stored in 1st buffer. Until TC1 overflow occurs, the new value moves to real TC1R buffer. This way can avoid TC1 interval time error and glitch in PWM and Buzzer output.

* **Note: Under PWM mode, auto-load is enabled automatically. The ALOAD0 bit is selecting overflow boundary.**

08DH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC1R	TC1R7	TC1R6	TC1R5	TC1R4	TC1R3	TC1R2	TC1R1	TC1R0
Read/Write	W	W	W	W	W	W	W	W
After reset	0	0	0	0	0	0	0	0

The equation of TC1R initial value is as following.

$$TC1R \text{ initial value} = N - (TC1 \text{ interrupt interval time} * \text{input clock})$$

N is TC1 overflow boundary number. TC1 timer overflow time has six types (TC1 timer, TC1 event counter, TC1 Fcpu clock source, TC1 Fosc clock source, PWM mode and no PWM mode). These parameters decide TC1 overflow time and valid value as follow table.

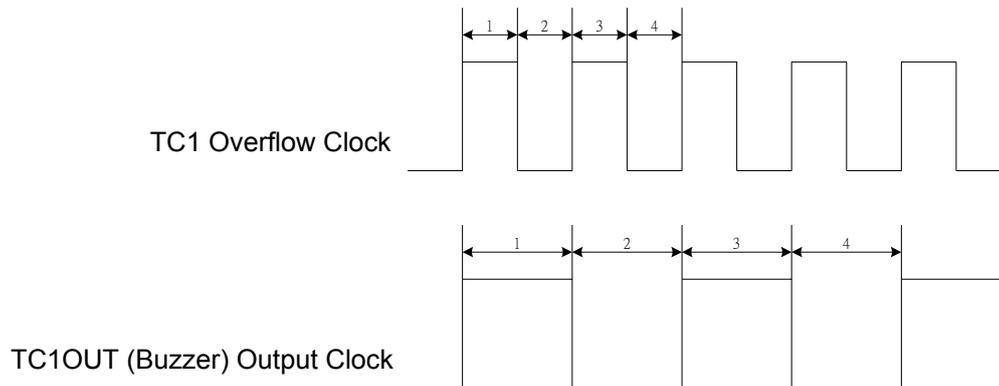

TC1CKS	PWM0	ALOAD0	TC1OUT	N	TC1R valid value	TC1R value binary type
0	0	x	x	256	0x00~0xFF	00000000b~11111111b
	1	0	0	256	0x00~0xFF	00000000b~11111111b
	1	0	1	64	0x00~0x3F	xx000000b~xx111111b
	1	1	0	32	0x00~0x1F	xxx00000b~xxx11111b
	1	1	1	16	0x00~0x0F	xxxx0000b~xxxx1111b
1	-	-	-	256	0x00~0xFF	00000000b~11111111b

Example: To set 1ms interval time for TC1 interrupt. TC1 clock source is Fcpu (TC1KS=0) and no PWM output (PWM0=0). High clock is internal 6MHz. Fcpu=Fosc/1. Select TC1RATE=010 (Fcpu/64).

$$\begin{aligned}
 TC1R \text{ initial value} &= N - (TC1 \text{ interrupt interval time} * \text{input clock}) \\
 &= 256 - (1ms * 6MHz / 1 / 64) \\
 &= 256 - (10^{-3} * 6 * 10^6 / 1 / 64) \\
 &= 162 \\
 &= A2H
 \end{aligned}$$

8.6.5 TC1 CLOCK FREQUENCY OUTPUT (BUZZER)

Buzzer output (TC1OUT) is from TC1 timer/counter frequency output function. By setting the TC1 clock frequency, the clock signal is output to P5.4 and the P5.4 general purpose I/O function is auto-disable. The TC1OUT frequency is divided by 2 from TC1 interval time. TC1OUT frequency is 1/2 TC1 frequency. The TC1 clock has many combinations and easily to make difference frequency. The TC1OUT frequency waveform is as following.

Example: Setup TC1OUT output from TC1 to TC1OUT (P5.4). The external high-speed clock is 4MHz. The TC1OUT frequency is 0.5KHz. Because the TC1OUT signal is divided by 2, set the TC1 clock to 1KHz. The TC1 clock source is from external oscillator clock. T0C rate is $F_{cpu}/4$. The $TC1RATE2 \sim TC1RATE1 = 110$. $TC1C = TC1R = 131$.

```

MOV      A,#01100000B
B0MOV    TC1M,A           ; Set the TC1 rate to Fcpu/4

MOV      A,#131
B0MOV    TC1C,A          ; Set the auto-reload reference value
B0MOV    TC1R,A

B0BSET   FTC1OUT         ; Enable TC1 output to P5.4 and disable P5.4 I/O function
B0BSET   FALOAD1         ; Enable TC1 auto-reload function
B0BSET   FTC1ENB        ; Enable TC1 timer

```

* **Note: Buzzer output is enable, and "PWM0OUT" must be "0".**

8.6.6 TC1 TIMER OPERATION SEQUENCE

TC1 timer operation includes timer interrupt, event counter, TC1OUT and PWM. The sequence of setup TC1 timer is as following.

☞ Stop TC1 timer counting, disable TC1 interrupt function and clear TC1 interrupt request flag.

```

☞          B0BCLR      FTC1ENB      ; TC1 timer, TC1OUT and PWM stop.
          B0BCLR      FTC1IEN      ; TC1 interrupt function is disabled.
          B0BCLR      FTC1IRQ      ; TC1 interrupt request flag is cleared.

```

☞ Set TC1 timer rate. (Besides event counter mode.)

```

          MOV          A, #0xxx0000b ;The TC1 rate control bits exist in bit4~bit6 of TC1M. The
          ; value is from x000xxxxb~x111xxxxb.
          B0MOV       TC1M,A        ; TC1 interrupt function is disabled.

```

☞ Set TC1 timer clock source.

; Select TC1 internal / external clock source.

```
          B0BCLR      FTC1CKS      ; Select TC1 internal clock source.
```

or

```
          B0BSET      FTC1CKS      ; Select TC1 external clock source.
```

☞ Set TC1 timer auto-load mode.

```
          B0BCLR      FALOAD0      ; Enable TC1 auto reload function.
```

or

```
          B0BSET      FALOAD0      ; Disable TC1 auto reload function.
```

☞ Set TC1 interrupt interval time, TC1OUT (Buzzer) frequency or PWM duty cycle.

; Set TC1 interrupt interval time, TC1OUT (Buzzer) frequency or PWM duty.

```

          MOV          A,#7FH      ; TC1C and TC1R value is decided by TC1 mode.
          B0MOV       TC1C,A      ; Set TC1C value.
          B0MOV       TC1R,A      ; Set TC1R value under auto reload mode or PWM mode.

```

; In PWM mode, set PWM cycle.

```

          B0BCLR      FALOAD0      ; ALOAD0, TC1OUT = 00, PWM cycle boundary is
          B0BCLR      FTC1OUT      ; 0~255.

```

or

```

          B0BCLR      FALOAD0      ; ALOAD0, TC1OUT = 01, PWM cycle boundary is
          B0BSET      FTC1OUT      ; 0~63.

```

or

```

          B0BSET      FALOAD0      ; ALOAD0, TC1OUT = 10, PWM cycle boundary is
          B0BCLR      FTC1OUT      ; 0~31.

```

or

```

          B0BSET      FALOAD0      ; ALOAD0, TC1OUT = 11, PWM cycle boundary is
          B0BSET      FTC1OUT      ; 0~15.

```

☞ Set TC1 timer function mode.

```
          B0BSET      FTC1IEN      ; Enable TC1 interrupt function.
```

or

```
          B0BSET      FTC1OUT      ; Enable TC1OUT (Buzzer) function.
```

or

```
          B0BSET      FPWM0OUT     ; Enable PWM function.
```

☞ Enable TC1 timer.

```
          B0BSET      FTC1ENB      ; Enable TC1 timer.
```

■ PWM1 MODE

◆ OVERVIEW

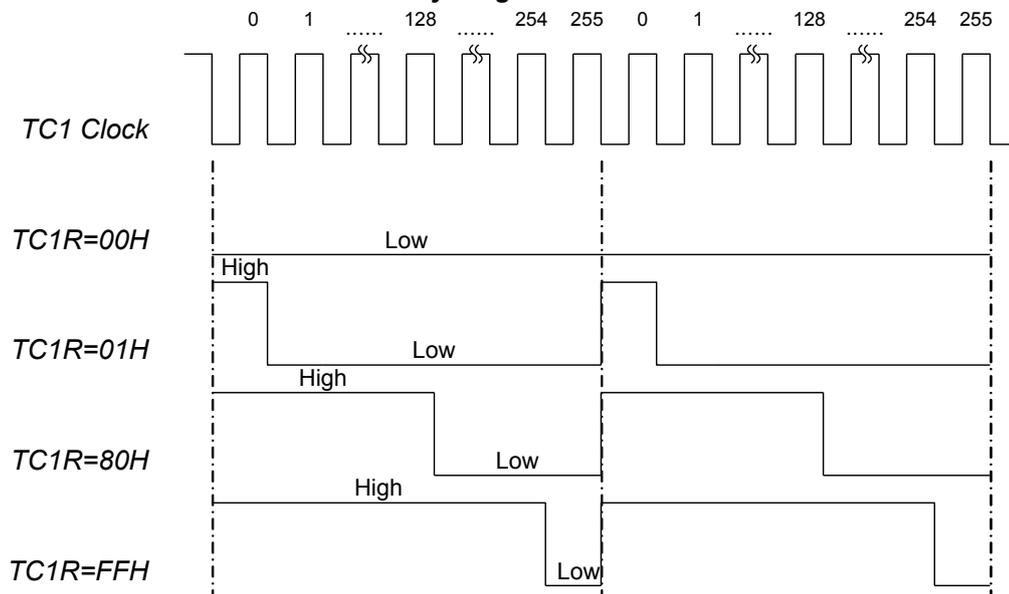

PWM function is generated by TC1 timer counter and output the PWM signal to PWM1OUT pin (P5.3). The 8-bit counter counts modulus 256, 64, 32, 16 controlled by ALOAD0, TC1OUT bits. The value of the 8-bit counter (TC1C) is compared to the contents of the reference register (TC1R). When the reference register value (TC1R) is equal to the counter value (TC1C), the PWM output goes low. When the counter reaches zero, the PWM output is forced high. The low-to-high ratio (duty) of the PWM1 output is TC1R/256, 64, 32, 16.

PWM output can be held at low level by continuously loading the reference register with 00H. Under PWM operating, to change the PWM's duty cycle is to modify the TC1R.

* **Note: TC1 is double buffer design. Modifying TC1R to change PWM duty by program, there is no glitch and error duty signal in PWM output waveform. Users can change TC1R any time, and the new reload value is loaded to TC1R buffer at TC1 overflow.**

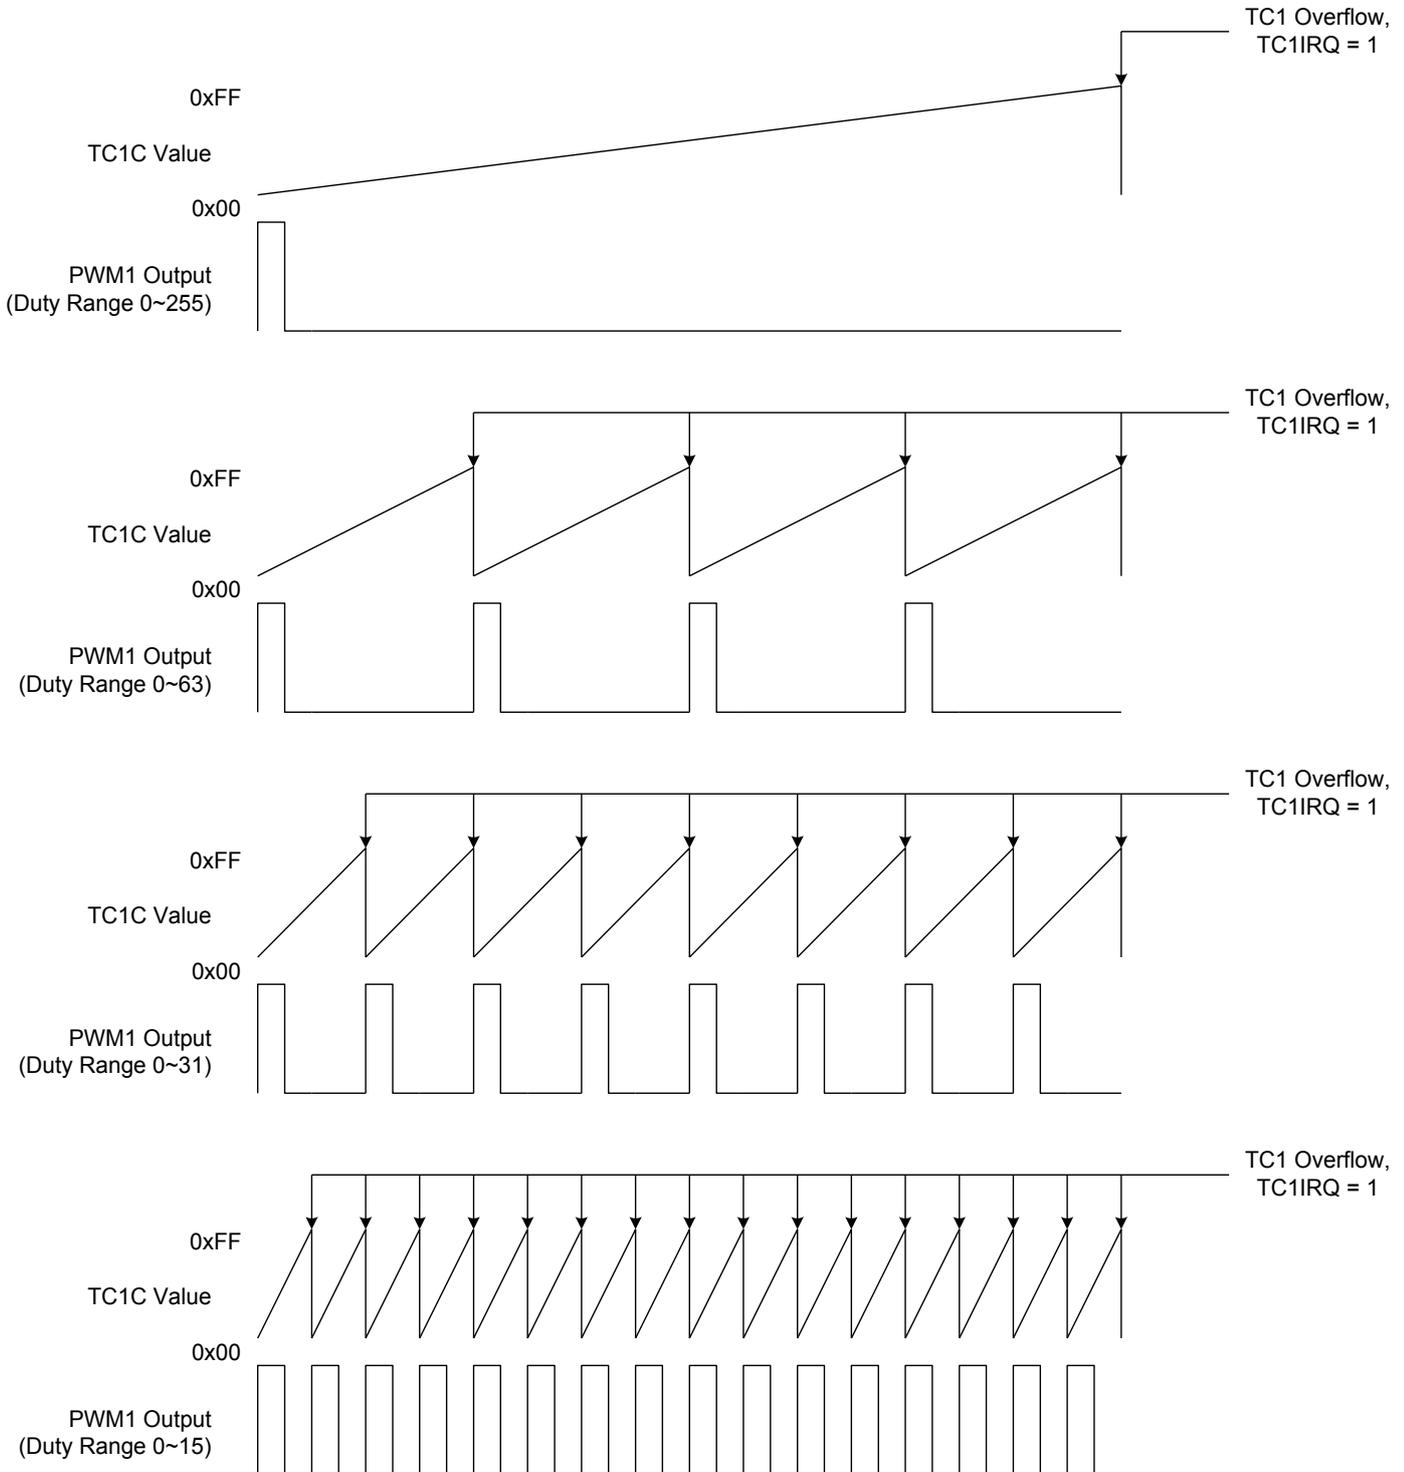

ALOAD0	TC1OUT	PWM duty range	TC1C valid value	TC1R valid bits value	MAX. PWM Frequency (Fcpu = 6MHz)	Remark
0	0	0/256~255/256	0x00~0xFF	0x00~0xFF	11.719K	Overflow per 256 count
0	1	0/64~63/64	0x00~0x3F	0x00~0x3F	46.875K	Overflow per 64 count
1	0	0/32~31/32	0x00~0x1F	0x00~0x1F	93.75K	Overflow per 32 count
1	1	0/16~15/16	0x00~0x0F	0x00~0x0F	187.5K	Overflow per 16 count

The Output duty of PWM is with different TC1R. Duty range is from 0/256~255/256.

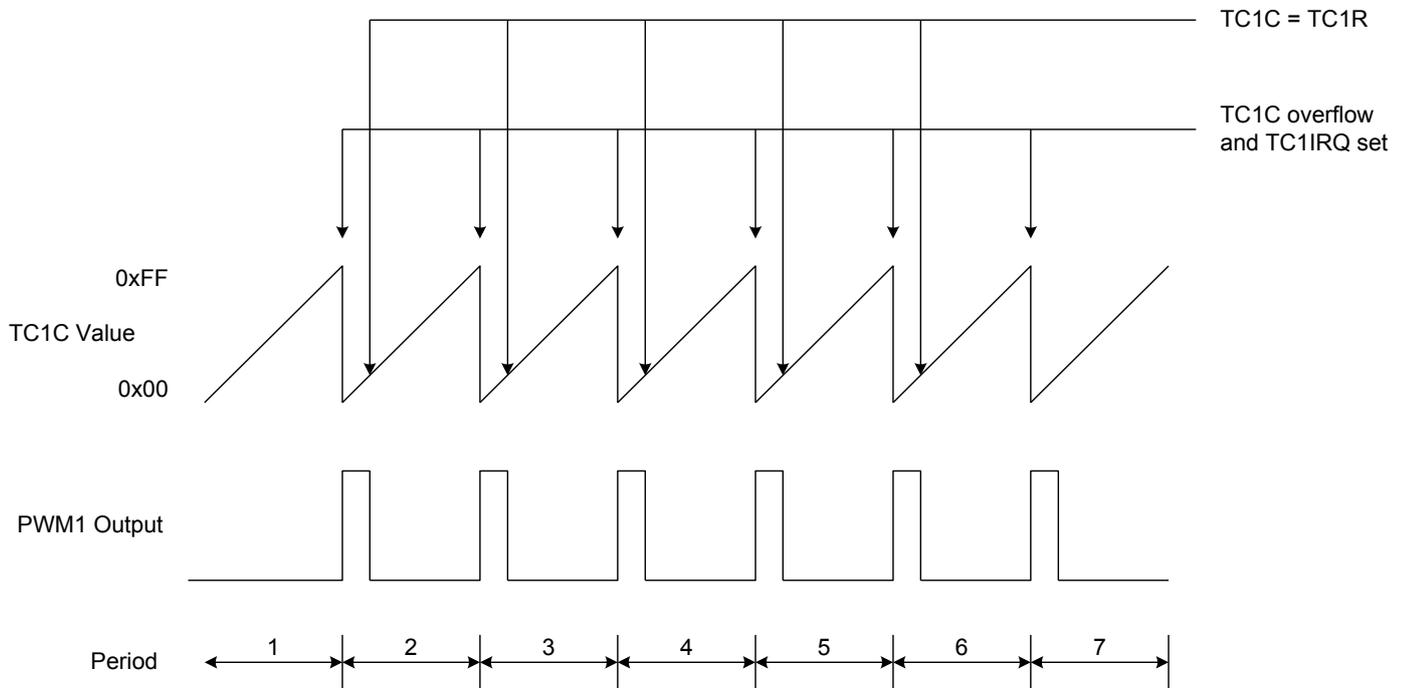

◆ TCxIRQ and PWM Duty

In PWM mode, the frequency of TC1IRQ is depended on PWM duty range. From following diagram, the TC1IRQ frequency is related with PWM duty.

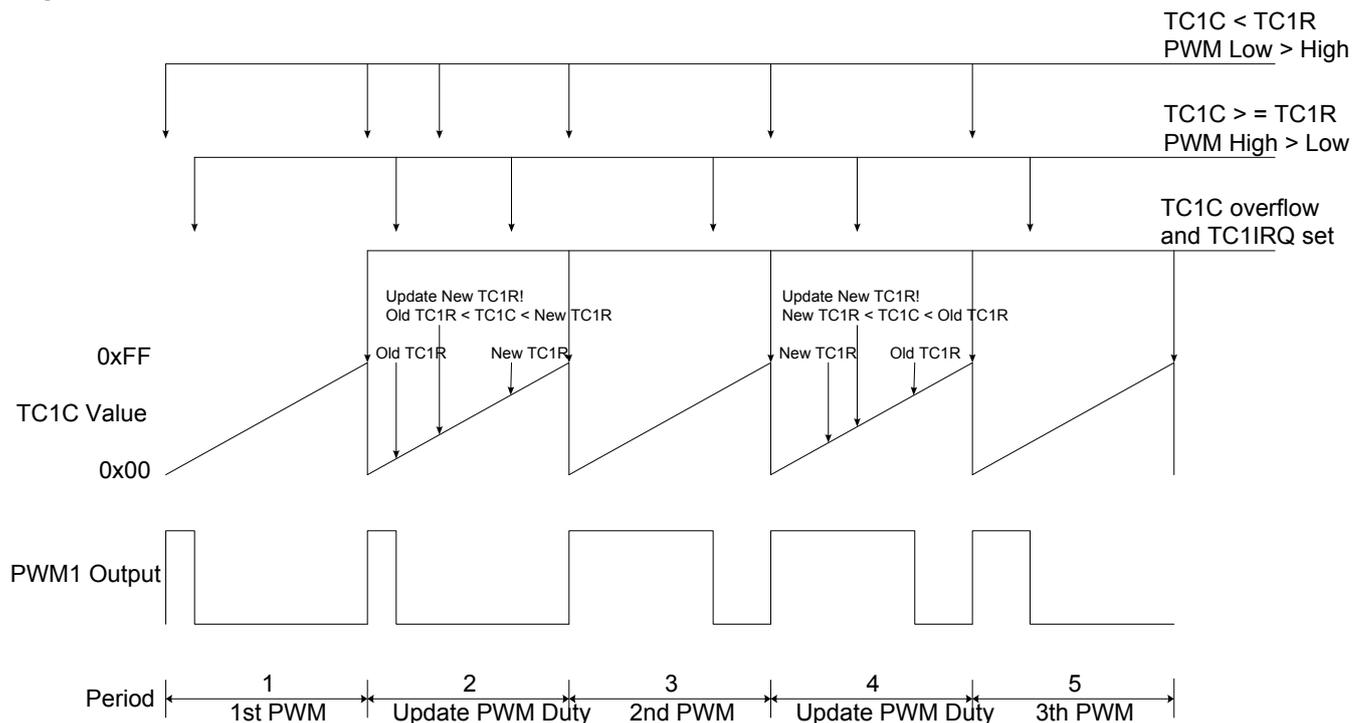

◆ PWM Duty with TCxR Changing

In PWM mode, the system will compare TC1C and TC1R all the time. When $TC1C < TC1R$, the PWM will output logic "High", when $TC1C \geq TC1R$, the PWM will output logic "Low". If TC1C is changed in certain period, the PWM duty will change in next PWM period. If TC1R is fixed all the time, the PWM waveform is also the same.

Above diagram is shown the waveform with fixed TC1R. In every TC1C overflow PWM output "High, when $TC1C \geq TC1R$ PWM output "Low". If TC1R is changing in the program processing, the PWM waveform will become as following diagram.

In period 2 and period 4, new Duty (TC1R) is set. TC1 is double buffer design. The PWM still keeps the same duty in period 2 and period 4, and the new duty is changed in next period. By the way, system can avoid the PWM not changing or H/L changing twice in the same cycle and will prevent the unexpected or error operation.

◆ PWM PROGRAM EXAMPLE

Example: Setup PWM1 output from TC1 to PWM1OUT (P5.3). The clock source is internal 6MHz. $F_{cpu} = F_{osc}/1$. The duty of PWM is 30/256. The PWM frequency is about 6KHz. The PWM clock source is from external oscillator clock. TC1 rate is $F_{cpu}/4$. The $TC1RATE2 \sim TC1RATE1 = 110$. $TC1C = TC1R = 30$.

```

MOV      A,#01100000B
B0MOV   TC1M,A           ; Set the TC1 rate to Fcpu/4

MOV      A,#30
B0MOV   TC1C,A           ; Set the PWM duty to 30/256
B0MOV   TC1R,A

B0BCLR  FTC1OUT          ; Set duty range as 0/256~255/256.
B0BCLR  FALOAD0
B0BSET  FPWM1OUT         ; Enable PWM1 output to P5.4 and disable P5.4 I/O function
B0BSET  FTC1ENB          ; Enable TC1 timer

```

* **Note:** The TC1R is write-only register. Don't process them using INCMS, DECMS instructions.

Example: Modify TC1R registers' value.

```

MOV      A, #30H
B0MOV   TC1R, A           ; Input a number using B0MOV instruction.

INCMS   BUF0              ; Get the new TC1R value from the BUF0 buffer defined by
NOP                                           ; programming.
B0MOV   A, BUF0
B0MOV   TC1R, A

```

* **Note:** The PWM can work with interrupt request.

9 UNIVERSAL SERIAL BUS (USB)

9.1 OVERVIEW

The USB is the answer to connectivity for the PC architecture. A fast, bi-directional interrupt pipe, low-cost, dynamically attachable serial interface is consistent with the requirements of the PC platform of today and tomorrow. The SONIX USB microcontrollers are optimized for human-interface computer peripherals such as a mouse, joystick, game pad.

USB Specification Compliance

- Conforms to USB specifications, Version 2.0.
- Supports 1 Full-speed USB device address.
- Supports 1 control endpoint, 3 interrupt endpoints.
- Integrated USB transceiver.
- 5V to 3.3V regulator output for D+ 1.5K ohm internal resistor pull up.

9.2 USB MACHINE

The USB machine allows the microcontroller to communicate with the USB host. The hardware handles the following USB bus activity independently of the microcontroller.

The USB machine will do:

- Translate the encoded received data and format the data to be transmitted on the bus.
- CRC checking and generation by hardware. If CRC is not correct, hardware will not send any response to USB host.
- Send and update the data toggle bit (Data1/0) automatically by hardware.
- Send appropriate ACK/NAK/STALL handshakes.
- SETUP, IN, or OUT Token type identification. Set the appropriate bit once a valid token is received.
- Place valid received data in the appropriate endpoint FIFOs.
- Bit stuffing/unstuffing.
- Address checking. Ignore the transactions not addressed to the device.
- Endpoint checking. Check the endpoint's request from USB host, and set the appropriate bit of registers.

Firmware is required to handle the rest of the following tasks:

- Coordinate enumeration by decoding USB device requests.
- Fill and empty the FIFOs.
- Suspend/Resume coordination.
- Remote wake up function.
- Determine the right interrupt request of USB communication.

9.3 USB INTERRUPT

The USB function will accept the USB host command and generate the relative interrupts, and the program counter will go to 0x08 vector. Firmware is required to check the USB status bit to realize what request comes from the USB host.

The USB function interrupt is generated when:

- The endpoint 0 is set to accept a SETUP token.
- The device receives an ACK handshake after a successful read transaction (IN) from the host.
- If the endpoint is in ACK OUT modes, an interrupt is generated when data is received.
- The USB host send USB suspend request to the device.
- USB bus reset event occurs.
- The USB endpoints interrupt after a USB transaction complete is on the bus.
- The SOF packet received if the SOF interrupt enable.
- The NAK handshaking when the NAK interrupt enable.

The following examples show how to avoid the error of reading or writing the endpoint FIFOs and to do the right USB request routine according to the flag.

9.4 USB ENUMERATION

A typical USB enumeration sequence is shown below.

1. The host computer sends a SETUP packet followed by a DATA packet to USB address 0 requesting the Device descriptor.
2. Firmware decodes the request and retrieves its Device descriptor from the program memory tables.
3. The host computer performs a control read sequence and Firmware responds by sending the Device descriptor over the USB bus, via the on-chip FIFO.
4. After receiving the descriptor, the host sends a SETUP packet followed by a DATA packet to address 0 assigning a new USB address to the device.
5. Firmware stores the new address in its USB Device Address Register after the no-data control sequence completes.
6. The host sends a request for the Device descriptor using the new USB address.
7. Firmware decodes the request and retrieves the Device descriptor from program memory tables.
8. The host performs a control read sequence and Firmware responds by sending its Device descriptor over the USB bus.
9. The host generates control reads from the device to request the Configuration and Report descriptors.
10. Once the device receives a Set Configuration request, its functions may now be used.
11. Firmware should take appropriate action for Endpoint 0~3 transactions, which may occur from this point.

9.5 USB REGISTERS

9.5.1 USB DEVICE ADDRESS REGISTER

The USB Device Address Register (UDA) contains a 7-bit USB device address and one bit to enable the USB function. This register is cleared during a reset, setting the USB device address to zero and disable the USB function.

090H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
UDA	UDE	UDA6	UDA5	UDA4	UDA3	UDA2	UDA1	UDA0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

Bit [6:0] **UDA [6:0]:** These bits must be set by firmware during the USB enumeration process (i.e., SetAddress) to the non-zero address assigned by the USB host.

Bit 7 **UDE: Device Function Enable.** This bit must be enabled by firmware to enable the USB device function.

0 = Disable USB device function.

1 = Enable USB device function.

9.5.2 USB STATUS REGISTER

The USB status register indicates the status of USB.

091H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
USTATUS			SOF	BUS_RST	SUSPEND	EP0_SETUP	EP0_IN	EP0_OUT
Read/Write			R/W	R	R	R/W	R/W	R/W
After reset			0	0	0	0	0	0

Bit 0 **EP0_OUT** : Endpoint 0 OUT Token Received.

0 = Endpoint 0 has no OUT token received.

1 = A valid OUT packet has been received. The bit is set to 1 after the last received packet in an OUT transaction.

Bit 1 **EP0_IN** : Endpoint 0 IN Token Received.

0 = Endpoint 0 has no IN token received.

1 = A valid IN packet has been received. The bit is set to 1 after the last received packet in an IN transaction.

Bit 2 **EP0_SETUP** : Endpoint 0 SETUP Token Received.

0 = Endpoint 0 has no SETUP token received.

1 = A valid SETUP packet has been received. The bit is set to 1 after the last received packet in an SETUP transaction. While the bit is set to 1, the HOST can not write any data in to EP0 FIFO. This prevents SIE from overwriting an incoming SETUP transaction before firmware has a chance to read the SETUP data.

Bit 3 **SUSPEND:** indicate USB suspend status.

0 = Non-suspend status. When MCU wakeup from sleep mode by USB resume wakeup request, the bit will

changes from 1 to 0 automatically.

1 = Set to 1 by hardware when USB suspend request.

Bit 4 BUS_RST: USB bus reset.

0 = Non-USB bus reset.

1 = Set to 1 by hardware when USB bus reset request.

Bit 5 SOF: Indicate the USB SIE's SOF packet is received

0 = Non USB SIE's SOF packet received.

1 = If SOF_INT_EN = 1 then this bit will set to 1 by hardware when the SOF packet is received. Otherwise the bit will always be 0. Clear this bit and also the **bit 7 of INTRQ register (0x C8)** by firmware.

9.5.3 USB DATA COUNT REGISTER

The USB EP0 OUT token data byte counter.

092H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
EP0OUT_CNT				UEP0OC4	UEP0OC3	UEP0OC2	UEP0OC1	UEP0OC0
Read/Write				R/W	R/W	R/W	R/W	R/W
After reset				0	0	0	0	0

Bit [4:0] UEP0C [4:0]: USB endpoint 0 OUT token data counter.

9.5.4 USB ENABLE CONTROL REGISTER

The register control the regulator output 3.3 volts enable, SOF packet receive interrupt, NAK handshaking interrupt and D+ internal 1.5k ohm pull up.

093H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
USB_INT_EN	REG_EN	DP_UP_EN	SOF_INT_EN			EP3NAK_INT_EN	EP2NAK_INT_EN	EP1NAK_INT_EN
Read/Write	R/W	R/W	R/W			R/W	R/W	R/W
After reset	1	0	0			0	0	0

Bit [2:0] EPnNAK_INT_EN [2:0]: EP1~EP3 NAK transaction interrupts enable control bits. n = 1, 2, 3.

0 = Disable NAK transaction interrupt request.

1 = Enable NAK transaction interrupt request.

Bit 5 SOF_INT_EN: USB SIE's SOF packet receive interrupt enable.

Clear the bit and the bit 7 of INTEN register (0x C9)

= Disable USB SIE's SOF interrupt request.

Set the bit and the bit 7 of INTEN register (0x C9) to 1

= Enable USB SIE's SOF interrupt request. The

Bit 6 DP_UP_EN: D+ internal 1.5k ohm pull up resistor control bit.

0 = Disable D+ pull up 1.5k ohm to 3.3volts.

1 = Enable D+ pull up 1.5k ohm to 3.3volts.

Bit 7 **REG_EN:** 3.3volts Regulator control bit.

0 = Disable regulator output 3.3volts.

1 = Enable regulator output 3.3volts.

9.5.5 USB endpoint's ACK handshaking flag REGISTER

The status of endpoint's ACK transaction.

094H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
EP_ACK						EP3_ACK	EP2_ACK	EP1_ACK
Read/Write						R/W	R/W	R/W
After reset						0	0	0

Bit [2:0] **EPn_ACK [2:0]:** EP1~EP3 ACK transaction. n= 1, 2, 3. The bit is set whenever the endpoint that completes with an ACK received.

0 = the endpoint (interrupt pipe) doesn't complete with an ACK.

1 = the endpoint (interrupt pipe) complete with an ACK.

9.5.6 USB endpoint's NAK handshaking flag REGISTER

The status of endpoint's NAK transaction.

095H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
EP_NAK						EP3_NAK	EP2_NAK	EP1_NAK
Read/Write						R/W	R/W	R/W
After reset						0	0	0

Bit [2:0] **EPn_NAK [2:0]:** EP1~EP3 NAK transaction. n = 1, 2, 3. The bit is set whenever the endpoint that completes with an NAK received.

0 = the EPnNAK_INT_EN = 0 or the endpoint (interrupt pipe) doesn't complete with an NAK.

1 = the EPnNAK_INT_EN = 1 and the endpoint (interrupt pipe) complete with an NAK.

9.5.7 USB ENDPOINT 0 ENABLE REGISTER

An endpoint 0 (EP0) is used to initialize and control the USB device. EP0 is bi-directional (Control pipe), as the device, can both receive and transmit data, which provides to access the device configuration information and allows generic USB status and control accesses.

096H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
UE0R	-	UE0M1	UE0M0	-	UE0C3	UE0C	UE0C1	UE0C0

Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

UDR0_R: Read the data from USB FIFO which UDP0 register point to.

0A6H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
UDR0_W	UDR0_W7	UDR0_W6	UDR0_W5	UDR0_W4	UDR0_W3	UDR0_W2	UDR0_W1	UDR0_W0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

UDR0_W: Write the data to USB FIFO which UDP0 register point to.

9.5.13 USB ENDPOINT OUT TOKEN DATA BYTES COUNTER

Endpoint 1's OUT TOKEN DATA BYTES COUNTER.

0A7H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
EP1OUT_CNT	-	-	-	UEP1OC4	UEP1OC3	UEP1OC2	UEP1OC1	UEP1OC0
Read/Write	-	-	-	R/W	R/W	R/W	R/W	R/W
After reset	-	-	-	0	0	0	0	0

Bit [4:0] **UEP1Cn:** Bytes counter of EP1 token data. Reset by firmware.

Endpoint 2's OUT TOKEN DATA BYTES COUNTER.

0A8H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
EP2OUT_CNT	-	-	-	UEP2OC4	UEP2OC3	UEP2OC2	UEP2OC1	UEP2OC0
Read/Write	-	-	-	R/W	R/W	R/W	R/W	R/W
After reset	-	-	-	0	0	0	0	0

Bit [4:0] **UEP2Cn:** Bytes counter of EP2 token data. Reset by firmware.

Endpoint 3's OUT TOKEN DATA BYTES COUNTER.

0A9H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
EP3OUT_CNT	-	-	-	UEP3OC4	UEP3OC3	UEP3OC2	UEP3OC1	UEP3OC0
Read/Write	-	-	-	R/W	R/W	R/W	R/W	R/W
After reset	-	-	-	0	0	0	0	0

Bit [4:0] **UEP3Cn:** Bytes counter of EP3 token data. Reset by firmware.

9.5.14 UPID REGISTER

Forcing bits allow firmware to directly drive the D+ and D- pins.

0ABH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
UPID	EP0OUT_EN	-	-	-	-	UBDE	DDP	DDN
Read/Write	R/W	-	-	-	-	R/W	R/W	R/W
After reset	0	-	-	-	-	0	0	0

Bit 0 **DDN:** Drive D- on the USB bus.

0 = drive D- low.

1 = drive D- high.

Bit 1 **DDP:** drive D+ on the USB bus.

0 = drive D+ low.

1 = drive D+ high.

Bit 2 **UBDE:** Enable to direct drive USB bus.

0 = disable.

1 = enable.

Bit 7 **EP0OUT_EN:** Enable EP0 control data out.

0 = disable.

1 = enable to receive the EP0 continuous OUT TOKEN data over 8 bytes.

9.5.15 ENDPOINT TOGGLE BIT CONTROL REGISTER

0ACH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
UTOGGLE	-	-	-	-	-	EP3 _DATA0/1	EP2 _DATA0/1	EP1 _DATA0/1
Read/Write	-	-	-	-	-	R/W	R/W	R/W
After reset	-	-	-	-	-	1	1	1

Bit [2:0] Endpoint 1~3's DATA0/1 toggle bit control.

0 = Clear the endpoint 1~3's toggle bit to DATA0

1 = hardware set toggle bit automatically.

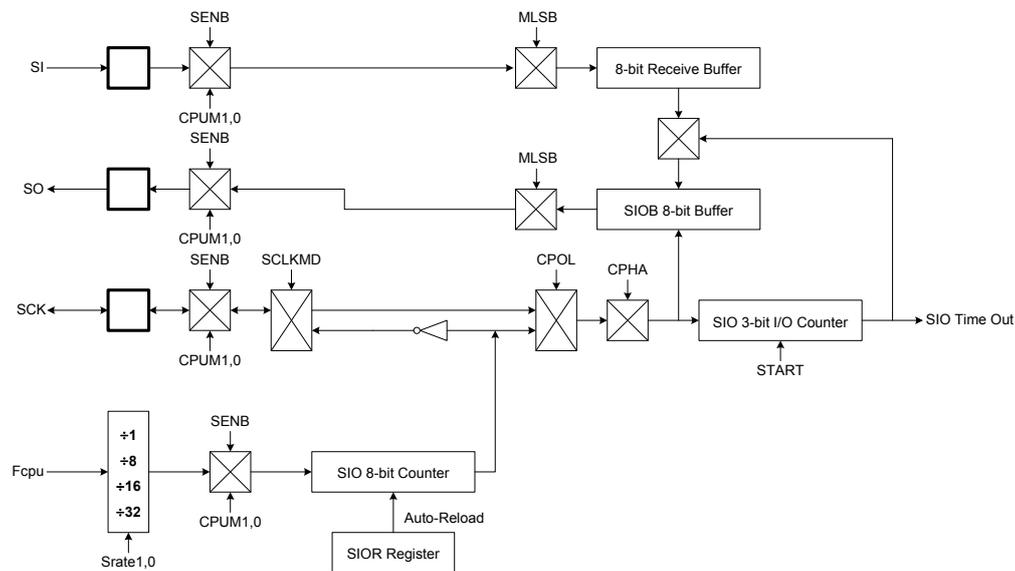

10 SERIAL INPUT/OUTPUT TRANSCEIVER

10.1 OVERVIEW

The SIO (serial input/output) transceiver allows high-speed synchronous data transfer between the SN8F2250B series MCU and peripheral devices or between several SN8F2250B devices. These peripheral devices may be Serial EEPROMs, shift registers, display drivers, etc. The SN8F2250B SIO features include the following:

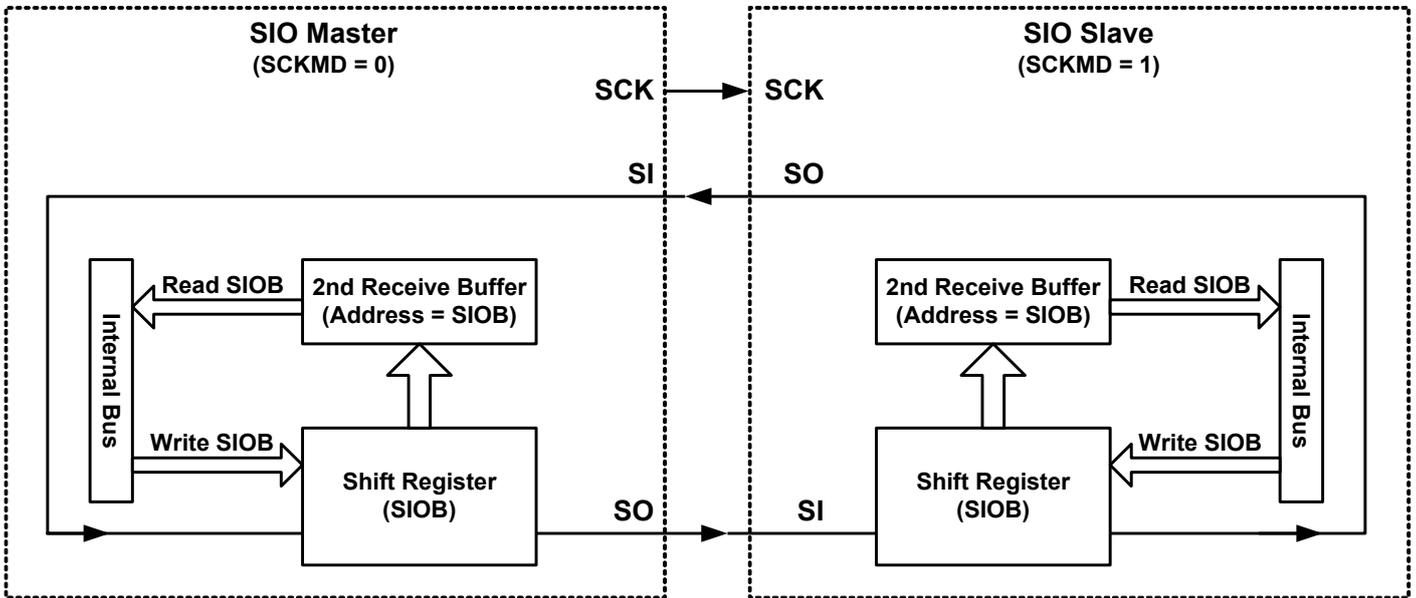

- Full-duplex, 3-wire synchronous data transfer
- TX/RX or TX Only mode
- Master (SCK is clock output) or Slave (SCK is clock input) operation
- MSB/LSB first data transfer
- SDO (P5.2) is programmable open-drain output pin for multiple slave devices application
- Two programmable bit rates (Only in master mode)
- End-of-Transfer interrupt

The SIOM register can control SIO operating function, such as: transmit/receive, clock rate, transfer edge and starting this circuit. This SIO circuit will transmit or receive 8-bit data automatically by setting SENB and START bits in SIOM register. The SIOB is an 8-bit buffer, which is designed to store transfer data. SIOC and SIOR are designed to generate SIO's clock source with auto-reload function. The 3-bit I/O counter can monitor the operation of SIO and announce an interrupt request after transmitting/receiving 8-bit data. After transferring 8-bit data, this circuit will be disabled automatically and re-transfer data by programming SIOM register.

SIO Interface Circuit Diagram

The system is single-buffered in the transmit direction and double-buffered in the receive direction. This means that bytes to be transmitted cannot be written to the SIOB Data Register before the entire shift cycle is completed. When receiving data, however, a received byte must be read from the SIOB Data Register before the next byte has been completely shifted in. Otherwise, the first byte is lost. Following figure shows a typical SIO transfer between two SN8F2250B micro-controllers. Master MCU sends SCK for initial the data transfer. Both master and slave MCU must work in the same clock edge direction, and then both controllers would send and receive data at the same time.

SIO Data Transfer Diagram

The SIO data transfer timing as following figure:

M L S B	C P O L	C P H A	SCK Idle Status	Diagrams
0	0	1	Low	
0	1	1	High	
0	0	0	Low	
0	1	0	High	
1	0	1	Low	
1	1	1	High	
1	0	0	Low	
1	1	0	High	

SIO Data Transfer Timing

10.2 SIOM MODE REGISTER

0B4H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
SIOM	SENB	START	SRATE1	SRATE0	MLSB	SCKMD	CPOL	CPHA
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

- Bit 7 **SENB:** SIO function control bit.
0 = Disable (P5.0~P5.2 is general purpose I/O port).
1 = Enable (P5.0~P5.2 is SIO pins).
- Bit 6 **START:** SIO progress control bit.
0 = End of transfer.
1 = Progressing.
- Bit [5:4] **SRATE1:0:** SIO's transfer rate select bit. **These 2-bits are workless when SCKMD=1.**
00 = Fcpu.
01 = Fcpu/32
10 = Fcpu/16
11 = Fcpu/8.
- Bit 3 **MLSB:** MSB/LSB transfer first.
0 = MSB transmit first.
1 = LSB transmit first.
- Bit 2 **SCKMD:** SIO's clock mode select bit.
0 = Internal. (Master mode)
1 = External. (Slave mode)
- Bit 1 **CPOL:** SIO's transfer clock edge select bit.
0 = SCK idle status is low status
1 = SCK idle status is high status
- Bit 0 **CPHA:** The Clock Phase bit controls the phase of the clock on which data is sampled.
0 = Data receive at the first clock phase.
1 = Data receive at the second clock phase.

*** Note: 1. If SCKMD=1 for external clock, the SIO is in SLAVE mode. If SCKMD=0 for internal clock, the SIO is in MASTER mode.
2. Don't set SENB and START bits in the same time. That makes the SIO function error.**

Because SIO function is shared with Port5 for P5.0 as SCK, P5.1 as SDI and P5.2 as SDO. The following table shown the Port5[2:0] I/O mode behavior and setting when SIO function enable and disable.

SENB=1 (SIO Function Enable)		
P5.0/SCK	(SCKMD=1) SIO source = External clock	P5.0 will change to Input mode automatically, no matter what P5M setting
	(SCKMD=0) SIO source = Internal clock	P5.0 will change to Output mode automatically, no matter what P5M setting
P5.1/SDI	P5.1 must be set as Input mode in P5M ,or the SIO function will be abnormal	
P5.2/SDO	SIO = Transmitter/Receiver	P5.2 will change to Output mode automatically, no matter what P5M setting
SENB=0 (SIO Function Disable)		
P5.0/P5.1/P5.2	Port5[2:0] I/O mode are fully controlled by P5M when SIO function is disable	

10.3 SIOB DATA BUFFER

0B6H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
SIOB	SIOB7	SIOB6	SIOB5	SIOB4	SIOB3	SIOB2	SIOB1	SIOB0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

SIOB is the SIO data buffer register. It stores serial I/O transmit and receive data.

10.4 SIOR REGISTER DESCRIPTION

0B5H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
SIOR	SIOR7	SIOR6	SIOR5	SIOR4	SIOR3	SIOR2	SIOR1	SIOR0
Read/Write	W	W	W	W	W	W	W	W
After reset	0	0	0	0	0	0	0	0

The SIOR is designed for the SIO counter to reload the counted value when end of counting. It is like a post-scaler of SIO clock source and let SIO has more flexible to setting SCK range. Users can set the SIOR value to setup SIO transfer time. **The valid SIOR value = 0x0 to 0xFD.** To setup SIOR value equation to desire transfer time is as following.

$$\text{SCK frequency} = \text{SIO rate} / (256 - \text{SIOR});$$

$$\text{SIOR} = 256 - (1 / (\text{SCK frequency}) * \text{SIO rate})$$

Example: Setup the SIO clock to be 2MHz. Fosc = 12MHz. SIO's rate = Fcpu/2. Fcpu = Fosc/1 = 12MHz.

$$\begin{aligned} \text{SIOR} &= 256 - (1/(2\text{MHz}) * 12\text{MHz}/2) \\ &= 256 - 3 \\ &= 253 \\ &= 0xFD \end{aligned}$$

Example: Master, duplex transfer and transmit data on rising edge

```

MOV      A, TXDATA      ; Load transmitted data into SIOB register.
B0MOV   SIOB, A
MOV     A, #0FEH       ; Set SIO clock
B0MOV   SIOR, A
MOV     A, #10000000B  ; Setup SIOM and enable SIO function.
B0MOV   SIOM, A
B0BSET  FSTART        ; Start transfer and receiving SIO data.
CHK_END:
B0BTS0  FSTART        ; Wait the end of SIO operation.
JMP     CHK_END
B0MOV   A, SIOB        ; Save SIOB data into RXDATA buffer.
MOV     RXDATA, A

```

Example: Slave, duplex transfer and transmit data on rising edge

```

MOV      A, TXDATA      ; Load transfer data into SIOB register.
B0MOV   SIOB, A
MOV     A, # 10000100B  ; Setup SIOM and enable SIO function.
B0MOV   SIOM, A
B0BSET  FSTART        ; Start transfer and receiving SIO data.
CHK_END:
B0BTS0  FSTART        ; Wait the end of SIO operation.
JMP     CHK_END
B0MOV   A, SIOB        ; Save SIOB data into RXDATA buffer.
MOV     RXDATA, A

```

11 Flash

11.1 OVERVIEW

The SN8F2250B series USB MCU integrated device feature in-system programmable (ISP) FLASH memory for convenient, upgradeable code storage. The FLASH memory may be programmed via the SONiX 8 bit MCU programming interface or by application code and USB interface for maximum flexibility. The SN8F2250B provides security options at the disposal of the designer to prevent unauthorized access to information stored in FLASH memory.

- The MCU is stalled during Flash write (program) and erase operations, although peripherals (USB, Timers, WDT, I/O, PWM, etc.) remain active.
- Interrupts will disable by firmware during a Flash write or erase operation.
- The Flash page containing the boot loader and code option (ROM address 0x2000 ~ 0x27FF) cannot be erased from application code when the code option's security1 enable.
- Watch dog timer should be clear before the Flash write or erase operation.
- The erase operation sets all the bits in the Flash page to logic 1.
- Hardware will hold system clock and automatically move out data from RAM and do programming, after programming finished, hardware will release system clock and let MCU execute the next instruction.(Recommend add two NOP instructions after this active).

11.2 FLASH PROGRAMMING/ERASE CONTROL REGISTER

0BAH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PECMD	PECMD7	PECMD6	PECMD5	PECMD4	PECMD3	PECMD2	PECMD1	PECMD0
Read/Write	W	W	W	W	W	W	W	W
After reset	0	0	0	0	0	0	0	0

Bit [7:0] **PECMD[7:0]: 0x5A: Page Program (32 words/page), 0xC3: Page Erase (128 words/page)**

11.3 PROGRAMMING/ERASE ADDRESS REGISTER

0BBH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PEROML	PEROML7	PEROML6	PEROML5	PEROML4	PEROML3	PEROML2	PEROML1	PEROML0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

Bit [7:0] **PEROML[7:0]:** Define the target starting low byte address [7:0] of Flash memory (10K x 16) which is going to be programmed or erased.

0BCH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PEROMH	PEROMH7	PEROMH6	PEROMH5	PEROMH4	PEROMH3	PEROMH2	PEROMH1	PEROMH0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

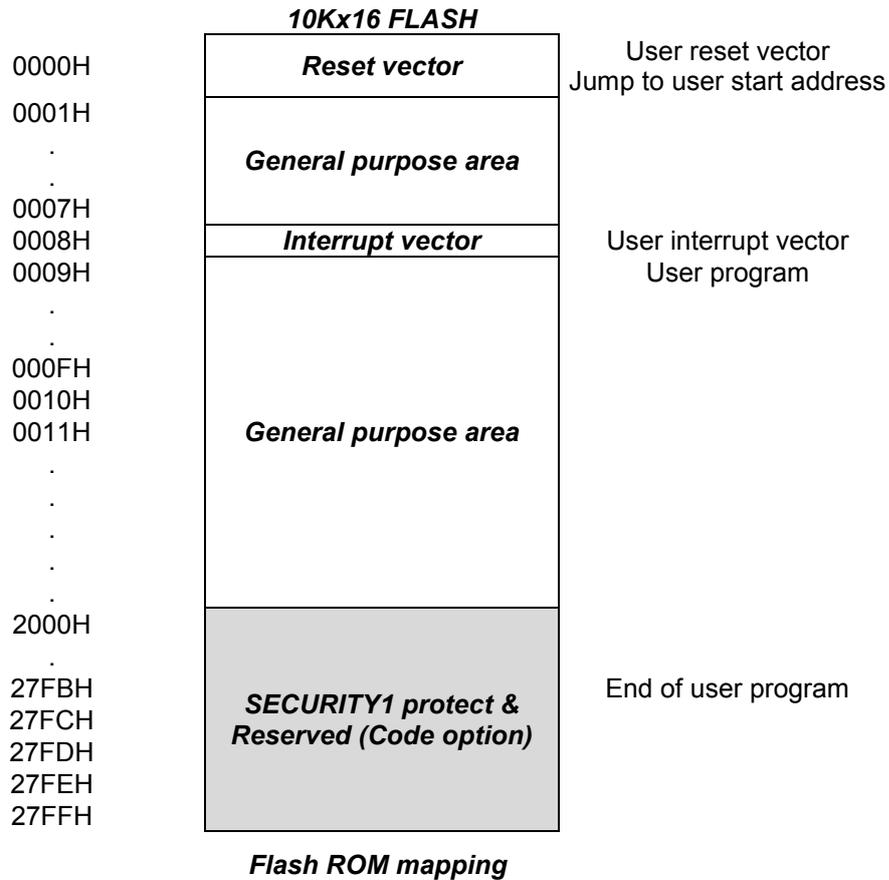

Bit [7:0] **PEROMH [7:0]:** Define the target starting high address [15:8] of Flash memory (10K x 16) which is going to be programmed or erased.

The valid **PAGE ERASE** starting addresses are **0x0, 0x80, 0x100, 0x180, 0x 200, 0x280, 0x300, 0x380 ... 0x2780**.

The page erase function is used to erase a page of 128 contiguous words in Flash ROM.

Note: If the code option **SECURITY1 = 0 (SECURITY1 disable)**, the code option address **0x27FC ~ 0x27FF** will **NOT** be protected by hardware. And the code option can be “erase and program” by the in-system-programming function. To avoid the error occur, when **SECURITY1 = 0 (SECURITY1 disable)**, please **DO NOT** set the **PAGE ERASE** starting address at **0x2780**.

The valid **PAGE PROGRAM** starting addresses are **0x0, 0x20, 0x40, 0x60, 0x80, 0xA0, 0xC0, 0xE0 ... 0x27E0**. The page program function is used to program a page of 32 contiguous words in Flash ROM.

Note:

1. If the code option SECURITY1 = 1 (SECURITY1 enable), the FLASH ROM ADDRESS = 0x2000 ~ 0x27FF will not allow to do the “page erase and page program”.
2. If the code option SECURITY1 = 0 (SECURITY1 disable), the code option address 0x27FC ~ 0x27FF will not be protected by hardware. And the code option can be “erase and program” by the in-system-programming function.

11.4 PROGRAMMING/ERASE DATA REGISTER

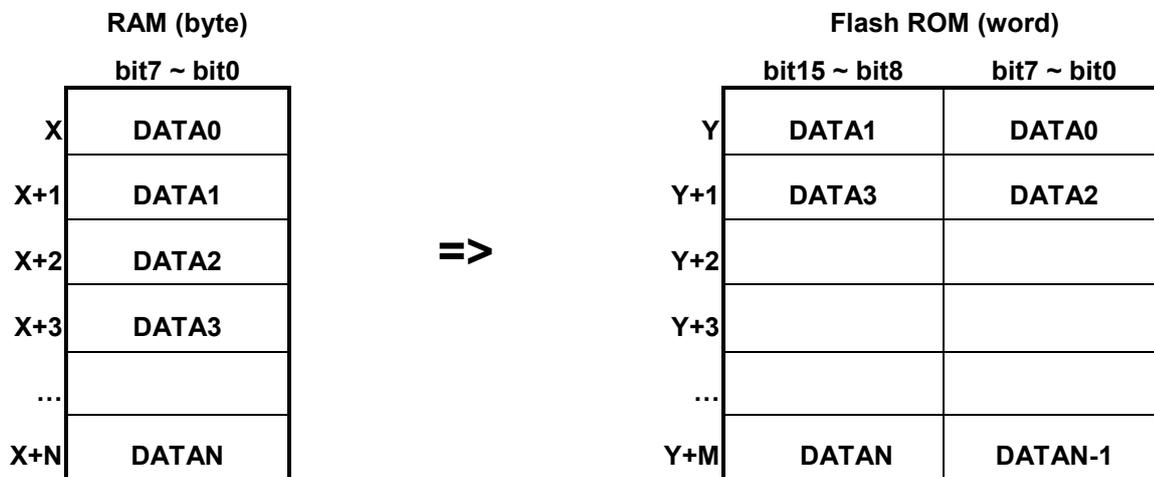

OBDH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PERAML	PERAML7	PERAML6	PERAML5	PERAML4	PERAML3	PERAML2	PERAML1	PERAML0

		PC \leftarrow Stack	-	-	-	2
		PC \leftarrow Stack, and to enable global interrupt	-	-	-	2
	To push ACC and PFLAG (except NT0, NPD bit) into buffers.	-	-	-	1	
	To pop ACC and PFLAG (except NT0, NPD bit) from buffers.	√	√	√	1	
	No operation	-	-	-	1	

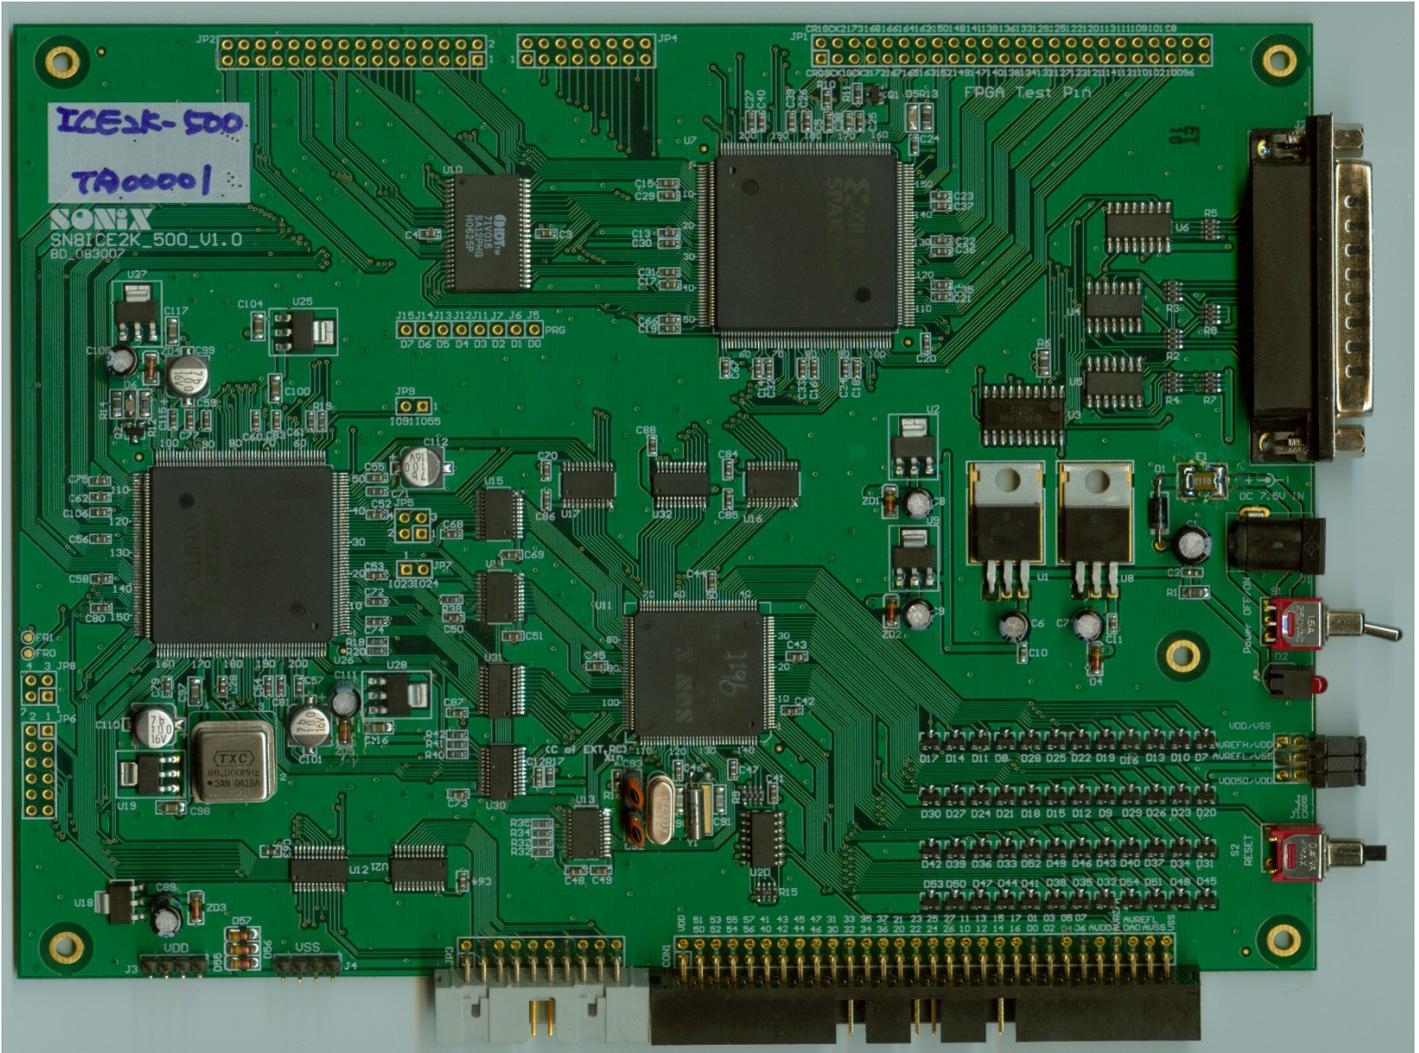

Note: 1. "M" is system register or RAM. If "M" is system registers then "N" = 0, otherwise "N" = 1.
2. If branch condition is true then "S = 1", otherwise "S = 0".

13 DEVELOPMENT TOOL

SONIX provides ICE (in circuit emulation), IDE (Integrated Development Environment), EV-kit and firmware library for USB application development. ICE and EV-kit is external hardware device and IDE is a friendly user interface for firmware development and emulation.

13.1 ICE (In Circuit Emulation)

The ICE called "SN8ICE2K Plus"

13.2 SN8F2250B EV-kit

The SN8F2250B and SN8F2250 use the same EV-kit. The EV-kit includes ICE interface, GPIO interface, USB interface, and VREG 3.3V power supply.

- ICE Interface: Interface connected to SN8ICE2K Plus
- GPIO Interface: SN8F2251/11/21/53/531/55 package form connector.
- USB Interface: USB Mini-B connector.
- VREG 3.3V Power Supply: Use SN8P2212's VREG to supply 3.3V power for VREG pin.

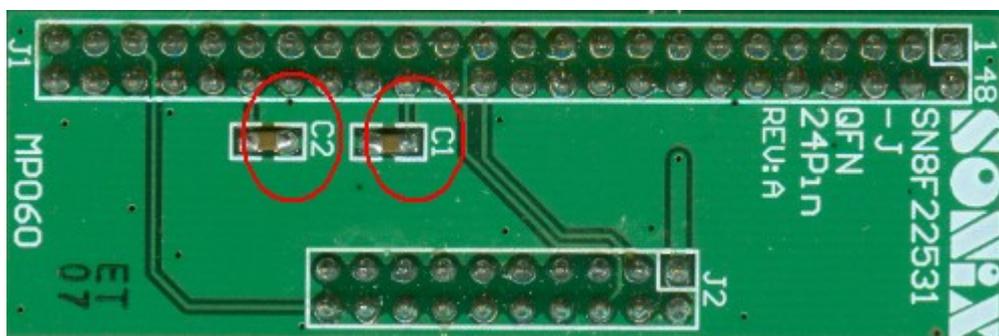

The outline of SN8F2250/SN8F2250B EV-kit is as following.

- J1: Jumper to connect between the 5V VDD from SN8ICE2K Plus and VDD_IC on SN8F2251/11/21/53/531/55 package form socket.
- J4: USB Mini-B connector.
- U8: SN8P2212 to supply 3.3V power for VREG pin and USB PHY.
- U9-U14: SN8F2251/11/21/53/531/55 connector for user's target board.

13.3 SN8F2250/SN8F2250B Transition Board

The SN8F2250 and SN8F2250B use the same transition boards. The Transition Boards includes total 6 models, and each of them is designated to each IC Package. The following shows the transition board outline for SN8F22531. Among the board, both C1 and C2 MUST be welded by 1uF capacitor.

14 ELECTRICAL CHARACTERISTIC

14.1 ABSOLUTE MAXIMUM RATING

Supply voltage (Vdd).....	- 0.3V ~ 6.0V
Input in voltage (Vin).....	Vss – 0.2V ~ Vdd + 0.2V
Operating ambient temperature (Topr) SN8F2251BJ, SN8F22521B/2253BS, SN8F22521BX, SN8F2253BJ, SN8F2255BF	0°C ~ + 70°C
Storage ambient temperature (Tstor)	–30°C ~ + 125°C

14.2 ELECTRICAL CHARACTERISTIC

(All of voltages refer to Vss, Vdd = 5.0V, fosc = 12MHz, ambient temperature is 25°C unless otherwise note.)

PARAMETER	SYM.	DESCRIPTION	MIN.	TYP.	MAX.	UNIT	
Operating voltage	Vdd1	Normal mode except USB transmitter specifications, Vpp = Vdd	4.0	5	5.5	V	
	Vdd2	USB mode	4.25	5	5.25	V	
RAM Data Retention voltage	Vdr		-	1.5*	-	V	
Vdd rise rate	Vpor	Vdd rise rate to ensure power-on reset	0.05	-	-	V/ms	
Input Low Voltage	ViL1	P0, P1, P5.3, P5.4 input ports	Vss	-	0.3Vdd	V	
	ViL2	P2, P5.0, P5.1, P5.2 input ports	Vss	-	0.2 VREG33	V	
Input High Voltage	ViH1	P0, P1, P5.3, P5.4 input ports	0.7Vdd	-	Vdd	V	
	ViH2	P2, P5.0, P5.1, P5.2 input ports	0.8 VREG33	-	Vdd	V	
Reset pin leakage current	Ilekg	Vin = Vdd	-	-	2	uA	
I/O port pull-up resistor Rup1	Rup1	P0, P1, P5.3, P5.4 's Vin = Vss, Vdd = 5V	25	40*	70	KΩ	
I/O port pull-up resistor Rup2	Rup2	P2, P5.0, P5.1, P5.2's Vin = Vss, Vdd = 5V	50	100*	150	KΩ	
D+ pull-up resistor	Rd+	Vdd = 5V, VREG = 3.3V	1.35	1.5	1.65	KΩ	
I/O port input leakage current	Ilekg	Pull-up resistor disable, Vin = Vdd	-	-	2	uA	
I/O output source current	IoH	Vop = Vdd – 1V	15	20*		mA	
	IoL	Vop = Vss + 0.4V		15*	20		
INTn trigger pulse width	Tint0	INT0 interrupt request pulse width	2/fcpu	-	-	cycle	
Page erase (128 words)	Terase	Flash ROM page erase time	-	25*	TBD	ms	
Page program (32 words)	Tpg	Flash ROM page program time (program 32 words)	-	1*	TBD	ms	
VREG33 Regulator current	IVREG33	VREG33 Max Regulator Output Current, Vcc > 4.35 volt with 10uF to GND	-	-	60	mA	
VREG33 Regulator GND current	Ivreg33_gnl	No loading. VREG33 pin output 3.3V ((Regulator enable)	-	70	100	uA	
VREG25 Regulator GND current	Ivreg25_gnl	No loading. VREG25 pin output 2.5V ((Regulator enable)	-	120	150	uA	
VREG33 Regulator Output voltage	Vreg1	VCC > 4.35V, 0 < temp < 40°C, IVREG ≤ 60 mA with 10uF to GND	3.0	-	3.6	V	
	Vreg2	VCC > 4.35V, 0 < temp < 40°C, IVREG ≤ 25 mA with 10uF to GND	3.1	-	3.6	V	
Supply Current	Idd1	normal Mode (No loading, Fcpu = Fosc/1)	Vdd= 5V, 12Mhz	-	10	15	mA
	Idd2	Slow Mode (Internal low RC)	Vdd= 5V, 24Khz	-	190	250	uA
	Idd3	Sleep Mode	Vdd= 5V	-	190	250	uA
	Idd4	Green Mode (No loading, Fcpu = Fosc/4)	Vdd= 5V, 12Mhz	-	5	10	mA

		Watchdog Disable)	Vdd=5V, ILRC 24Khz	-	190	250	uA
LVD Voltage	Vdet	Low voltage reset level.		2.0	2.4	2.9	V

* These parameters are for design reference, not tested.

17 Marking Definition

17.1 INTRODUCTION

There are many different types in Sonix 8-bit MCU production line. This note listed the production definition of all 8-bit MCU for order or obtain information.

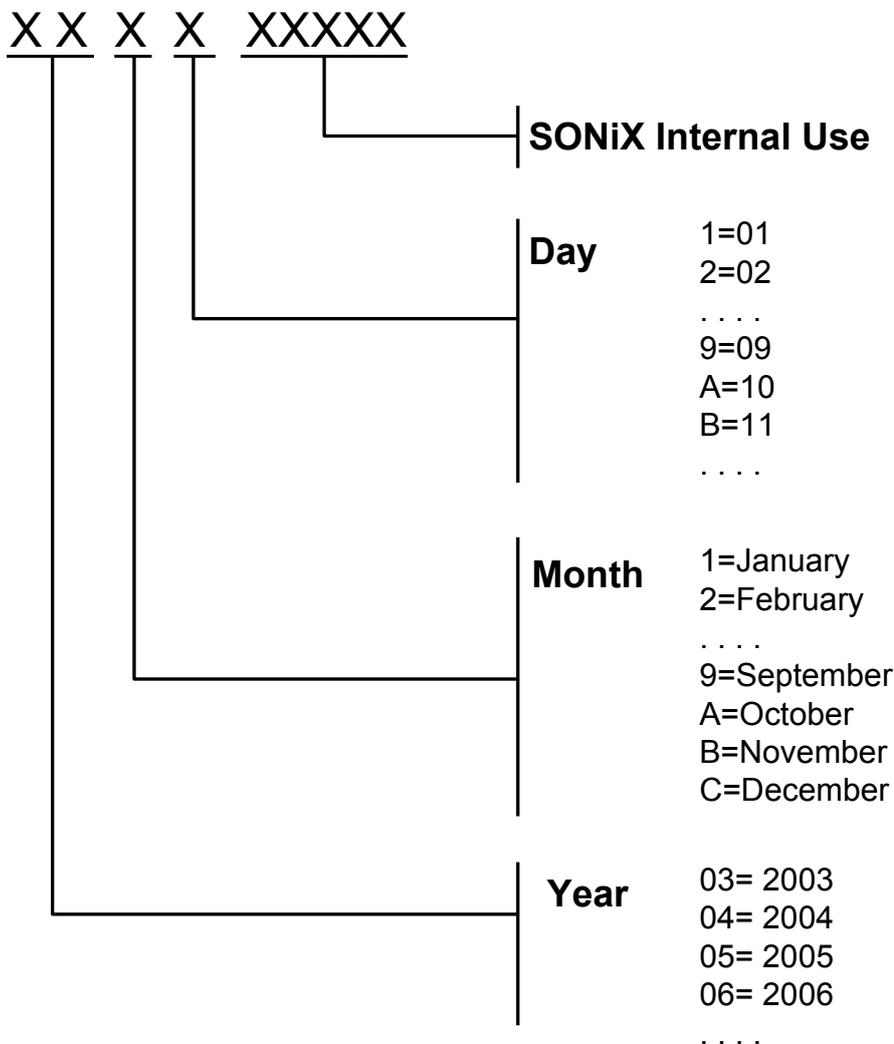

17.2 MARKING INDETIFICATION SYSTEM

17.3 MARKING EXAMPLE

Name	ROM Type	Device	Package	Temperature	Material
SN8F2253BSB	Flash memory	2253B	SOP	0°C~70°C	PB-Free Package
SN8F2253BXB	Flash memory	2253B	SSOP	0°C~70°C	PB-Free Package
SN8F2251BJG	Flash memory	2251B	QFN	0°C~70°C	Green Package
SN8F2253BSG	Flash memory	2253B	SOP	0°C~70°C	Green Package
SN8F2253BXG	Flash memory	2253B	SSOP	0°C~70°C	Green Package
SN8F2255BFG	Flash memory	2255B	LQFP	0°C~70°C	Green Package
SN8F2253BW	Flash memory	2253B	Wafer	0°C~70°C	-
SN8F2253BH	Flash memory	2253B	Dice	0°C~70°C	-

17.4 DATECODE SYSTEM

SONIX reserves the right to make change without further notice to any products herein to improve reliability, function or design. SONIX does not assume any liability arising out of the application or use of any product or circuit described herein; neither does it convey any license under its patent rights nor the rights of others. SONIX products are not designed, intended, or authorized for use as components in systems intended, for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SONIX product could create a situation where personal injury or death may occur. Should Buyer purchase or use SONIX products for any such unintended or unauthorized application. Buyer shall indemnify and hold SONIX and its officers, employees, subsidiaries, affiliates and distributors harmless against all claims, cost, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use even if such claim alleges that SONIX was negligent regarding the design or manufacture of the part.
