## USER'S MANUAL

Specification V1.0

# SONiX 8-Bit Micro-Controller

SONiX reserves the right to make change without further notice to any products herein to improve reliability, function or design. SONiX does not assume any liability arising out of the application or use of any product or circuit described herein; neither does it convey any license under its patent rights nor the rights of others. SONiX products are not designed, intended, or authorized for us as components in systems intended, for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SONiX product could create a situation where personal injury or death may occur. Should Buyer purchase or use SONiX products for any such unintended or unauthorized application. Buyer shall indemnify and hold SONiX and its officers, employees, subsidiaries, affiliates and distributors harmless against all claims, cost, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use even if such claim alleges that SONiX was negligent regarding the design or manufacture of the part.

| ADC Resolution                                    | 16-Bit                     | 20-Bit                               | 20-Bit                               |
| ADC Stable Time                                   | Slow (0.5s)                | Fast (3 x ADC_WR)                    | Fast (2 x ADC_WR)                    |
| ADC WR (Output Rate)                              | 1Hz ~ 50Hz                 | 1Hz ~ 3.9kHz                         | 1Hz ~ 3.9kHz                         |
| ADC Fast Measurement                              | No                         | Yes                                  | Yes                                  |
| ADC Work in Slow/Green Mode with Wake up function | No                         | Yes                                  | Yes                                  |
| Battery Detect Method                             | By ADC or Comparator       | By ADC or Comparator (LBT:2.2~2.9V)  | By ADC or Comparator (LBT:2.2~2.9V)  |
| High Clock  | IHRC or 4MHz Crystal       | IHRC                                 | IHRC                                 |
| LCD Type  | R-Type only                | R-Type or C-Type                     | R-Type or C-Type                     |
| VLCD and VLCD1 Voltage                            | VLCD Pin Only              | VLCD Pin Only                        | VLCD Pin Only                        |
| Capacitors Requirement                            | More                       | Less (Chip Cap.)                     | Less (Chip Cap.)                     |
| LED Backlight Power                               | AVDDR or AVE+              | VLED (3.5V)                          | VLED(3.5V)                           |
| ISP Function for sensor calibration               | Yes                        | Yes                                  | Yes                                  |
| Touch Key Function                                | No                         | No                                   | Yes                                  |
| ISP Vpp source and voltage                        | External 12.5V             | External 6.5V or Internal generation | External 6.5V or Internal generation |

Table 1-2 SN8Px9x9 Migration Table

## 1.1 FEATURES

### ◆ **Memory configuration**

OTP ROM size: 4K \* 16 bits  
RAM size: 256 \* 8 bits (bank 0, bank 1)  
8-levels stack buffer  
LCD RAM size: 4\*20bits

### ◆ **I/O pin configuration**

Bi-directional: P0, P2, P5  
Wakeup: P0  
Pull-up resistors: P0, P2, P5  
External interrupt: P00, P01

### ◆ **Touch Key Function: 4-Keys**

### ◆ **Powerful instructions**

Four clocks per instruction cycle  
All instructions are one word length  
Most of instructions are 1 cycle only  
Maximum instruction cycle is “2”  
JMP instruction jumps to all ROM area  
All ROM area look-up table function (MOVC)

### ◆ **Three 8-Bit Timer**

T0: Basic Timer, Build in 0.5 sec RTC mode  
T1: 16-Bit + 12-Bit Timer for touch function  
TC0: Auto-reload Timer/Counter/PWM0/Buzzer

### ◆ **Programmable Gain Instrumentation Amplifier**

### ◆ **PGIA Gain Option: 1x/12.5x/50x/100x/200x**

### ◆ **20-bit Delta-Sigma ADC with 18-bit Noise Free**

ADC Gain selection: 1x, 2x, 4x  
ADC Offset selection: (-3/4, -1/2, -1/4, 0) x Vref  
ADC Interrupt with Green Mode wakeup function  
Three ADC channel configuration:  
Two Fully Differential Channels  
One Differential and Two Single-ended Channels  
Four Single-ended Channels

### ◆ **Six Interrupt Sources**

Four Internal Interrupts:T0, T1, TC0, CM0, ADC  
Two External Interrupts: INT0, INT1

### ◆ **Single Power Supply: 2.4V ~ 3.6V(Analog Part)**

2.2V ~ 3.6V(Digit Part)

### ◆ **On-chip Watchdog Timer**

### ◆ **On-chip Regulator (AVDDR) with 2.4V Voltage Output and 10mA Driven Current**

### ◆ **On-chip Charge Pump Regulator (VLED) with 3.4V Voltage Output and 8mA Driven Current for LED Drive.**

### ◆ **On Chip Regulator with 2.0V / 1.5V Output Voltage**

### ◆ **AVE+ Loading Current Consumption will Not Double**

### ◆ **On-chip 1.2V Band Gap Reference for Battery Monitor**

### ◆ **Internal LBT 2.2V~2.9V; or External P52 Input LBT**

### ◆ **Build in ADC reference voltage: internal 0.3V~ 0.8V External reference voltage input V(R+,R-)**

### ◆ **In-system Programmer ROM: Internal 6.5V Generation for VPP**

### ◆ **LCD driver:**

1/3 or 1/2 bias voltage. With 1/4 duty only  
4 common \* 20segment  
Both R type and C type LCD  
Multiple C-type LCD Voltage: 2.7 ~3.4V  
R-type optional Bias Resistor: 400k, 200k, 100k, 33k  
C-Type LCD Duty Control Function

### ◆ **Dual clock system offers four operating modes**

High clock : IHRC 4 MHz only  
Low clock : ILRC 32kHz or 32768 Crystal @IHRC\_RTC  
Normal Mode: Both High and Low Clock Active  
Slow Mode: Low Clock Active and Optional High Clock  
Green Mode: Low Clock Active and Optional High Clock  
Wakeup by P0/T0/T1/TC0/ADC  
Sleep Mode: Both High and Low Clock Stop

### ◆ **Package**

Dice /LQFP64

## 1.4 PIN DESCRIPTIONS

| PIN NAME      | TYPE | DESCRIPTION  |
|---------------|------|--|
| DVDD, DVSS    | P    | Power supply input pins for digital circuit.   |
| AVDD, AVSS    | P    | Power supply input pins for analog circuit.  |
| CL+, CL-      | P    | Charge pump pins for VLCD, connect 0.1uf Cap.  |
| C+, C-        | P    | Charge pump pins for VLED, connect 1uf Cap.  |
| VPUMP         | P    | Charge pump output voltage (2 x VDD) for LED regulator, connects 1uf Cap to gnd.   |
| VLED          | P    | Charge pump regulator output voltage for LED power. Connect 1uf Cap to gnd.<br>VLED = 3.5V, Max output current = 8mA. Operation within VDD form 2.4V~3.6V.     |
| AVDDR         | P    | Regulator power output pin, Voltage = 2.4V/2.9V. Connect 1uf Cap to gnd.<br>AVDDR is analog circuit power source.(PGIA, ADC..)                                 |
| AVE+          | P    | Regulator output = 2.0/1.5V for Sensor. Maximum output current = 10mA.<br>Connect 1uf Cap to gnd.  |
| ACM           | P    | ACM Voltage output = 1V. Connect 0.1uf to AVDDR.   |

## 2.1.2 RESET VECTOR (0000H)

A one-word vector address area is used to execute system reset.

- ☞ Power On Reset
- ☞ Watchdog Reset

After power on reset or watchdog timer overflow reset, then the chip will restart the program from address 0000h and all system registers will be set as default values. The following example shows the way to define the reset vector in the program memory.

### ➤ Example: Defining Reset Vector

```
ORG      0          ; 0000H
JMP      START      ; Jump to user program address.
...
ORG      10H        ; 0010H, The head of user program.
START:   ...
         ...          ; User program
         ...
ENDP    ; End of program
```

### 2.1.2.1 INTERRUPT VECTOR (0008H)

A 1-word vector address area is used to execute interrupt request. If any interrupt service executes, the program counter (PC) value is stored in stack buffer and jump to 0008h of program memory to execute the vectored interrupt. Users have to define the interrupt vector. The following example shows the way to define the interrupt vector in the program memory.

\* **Note: Users have to save and load ACC and PFLAG register by program as interrupt occurrence.**

➤ Example: Defining Interrupt Vector. The interrupt service routine is following ORG 8.

```
.DATA      ACCBUF    DS 1      ; Define ACCBUF for store ACC data.  
          PFLAGBUF DS 1      ; Define PFLAGBUF for store PFLAG data.  
  
.CODE  
          ORG      0      ; 0000H  
          JMP      START    ; Jump to user program address.  
          ...  
          ORG      8      ; Interrupt vector.  
          B0XCH    A, ACCBUF  ; Save ACC in a buffer.  
          B0MOV    A, PFLAG   ; Save PFLAG register in a buffer.  
          B0MOV    PFLAGBUF, A ; Save PFLAG register in a buffer.  
          ...  
          ...  
          B0MOV    A, PFLAGBUF ; Restore PFLAG register from buffer.  
          B0MOV    PFLAG, A    ; Restore ACC from buffer.  
          B0XCH    A, ACCBUF  ; End of interrupt service routine  
          RETI  
          ...  
  
START:    ...  
          ...  
          ; The head of user program.  
          ; User program  
          ...  
          JMP      START    ; End of user program  
          ...  
          ...  
          ENDP      ; End of program
```

- Example: Defining Interrupt Vector. The interrupt service routine is following user program.

```

.DATA          ACCBUF   DS  1      ; Define ACCBUF for store ACC data.
              PFLAGBUF DS  1      ; Define PFLAGBUF for store PFLAG data.

.CODE
              ORG      0          ; 0000H
              JMP      START       ; Jump to user program address.
              ...
              ORG      8          ; Interrupt vector.
              JMP      MY_IRQ     ; 0008H, Jump to interrupt service routine address.

              ORG      10H        ; 0010H, The head of user program.
START:        ...          ; User program.
              ...
              ...
              JMP      START       ; End of user program.
              ...
              ...
              ...
MY_IRQ:
              B0XCH    A, ACCBUF   ;The head of interrupt service routine.
              B0MOV    A, PFLAG     ; Save ACC in a buffer.
              B0MOV    PFLAGBUF, A  ; Save PFLAG register in a buffer.
              ...
              ...
              B0MOV    A, PFLAGBUF ; Restore PFLAG register from buffer.
              B0MOV    PFLAG, A     ; Restore ACC from buffer.
              B0XCH    A, ACCBUF   ; End of interrupt service routine.
              ...
              ...
              RETI               ; End of program.

ENDP           ; End of program.

```

\* Note: It is easy to understand the rules of SONIX program from demo programs given above. These points are as following:

1. The address 0000H is a “JMP” instruction to make the program starts from the beginning.
2. The address 0008H is interrupt vector.
3. User’s program is a loop routine for main purpose application.

### 2.1.2.1 LOOK-UP TABLE DESCRIPTION

In the ROM’s data lookup function, Y register is pointed to middle byte address (bit 8~bit 15) and Z register is pointed to low byte address (bit 0~bit 7) of ROM. After MOVC instruction executed, the low-byte data will be stored in ACC and high-byte data stored in R register.

- Example: To look up the ROM data located “TABLE1”.

```

B0MOV    Y, #TABLE1$M  ; To set lookup table1's middle address
B0MOV    Z, #TABLE1$L  ; To set lookup table1's low address.
MOVC     ; To lookup data, R = 00H, ACC = 35H
          ; Increment the index address for next address.
INCMS   Z              ; Z+1
JMP     @F              ; Z is not overflow.
INCMS   Y              ; Z overflow (FFH → 00), → Y=Y+1
NOP     ; 

```

```
@@:      MOVC          ;  
         ...           ; To lookup data, R = 51H, ACC = 05H.  
TABLE1:   DW 0035H     ;  
         DW 5105H     ; To define a word (16 bits) data.  
         DW 2012H     ...  
         ...
```

\* Note: The Y register will not increase automatically when Z register crosses boundary from 0xFF to 0x00. Therefore, user must take care such situation to avoid look-up table errors. If Z register is overflow, Y register must be added one. The following INC\_YZ macro shows a simple method to process Y and Z registers automatically.

➤ Example: INC\_YZ macro.

```
INC_YZ      MACRO  
INCMS       Z          ; Z+1  
JMP        @F          ; Not overflow  
  
INCMS       Y          ; Y+1  
NOP        ; Not overflow  
@@:        ENDM
```

➤ Example: Modify above example by “INC\_YZ” macro.

|               |               |  |
|---------------|---------------|--|
| B0MOV         | Y, #TABLE1\$M | ; To set lookup table1's middle address                |
| B0MOV         | Z, #TABLE1\$L | ; To set lookup table1's low address.                  |
| MOVC          |               | ; To lookup data, R = 00H, ACC = 35H                   |
| <b>INC_YZ</b> |               | <b>; Increment the index address for next address.</b> |
| @ @:          | MOVC          | ;  |
|               | ...           | ;  |
| TABLE1:       | DW 0035H      | ; To define a word (16 bits) data.                     |
|               | DW 5105H      |  |
|               | DW 2012H      |  |
|               | ...           |  |

The other example of look-up table is to add Y or Z index register by accumulator. Please be careful if “carry” happen.

➤ Example: Increase Y and Z register by B0ADD/ADD instruction.

|               |                |   |
|---------------|----------------|---|
| B0MOV         | Y, #TABLE1\$M  | ; To set lookup table's middle address. |
| B0MOV         | Z, #TABLE1\$L  | ; To set lookup table's low address.    |
| <b>B0MOV</b>  | <b>A, BUF</b>  | <b>; Z = Z + BUF.</b>                   |
| <b>B0ADD</b>  | <b>Z, A</b>    |   |
| <b>B0BTS1</b> | <b>FC</b>      | <b>; Check the carry flag.</b>          |
| <b>JMP</b>    | <b>GETDATA</b> | <b>; FC = 0</b>                         |
| <b>INCMS</b>  | <b>Y</b>       | <b>; FC = 1. Y+1.</b>                   |
| <b>NOP</b>    |                |   |
| GETDATA:      | MOVC           | ;                                       |
|               | ...            | ;                                       |
| TABLE1:       | DW 0035H       | ; To define a word (16 bits) data.      |
|               | DW 5105H       |   |
|               | DW 2012H       |   |
|               | ...            |   |

### 2.1.2.2 JUMP TABLE DESCRIPTION

The jump table operation is one of multi-address jumping function. Add low-byte program counter (PCL) and ACC value to get one new PCL. The new program counter (PC) points to a series jump instructions as a listing table. It is easy to make a multi-jump program depends on the value of the accumulator (A).

When carry flag occurs after executing of “ADD PCL, A”, it will not affect PCH register. Users have to check if the jump table leaps over the ROM page boundary or the listing file generated by SONIX assembly software. If the jump table leaps over the ROM page boundary (e.g. from xxFFH to xx00H), move the jump table to the top of next program memory page (xx00H). **Here one page mean 256 words.**

\* Note: Program counter can't carry from PCL to PCH when PCL is overflow after executing addition instruction.

➤ Example: Jump table.

|       |         |   |
|-------|---------|---|
| ORG   | 0X0100  | ; The jump table is from the head of the ROM boundary |
| B0ADD | PCL, A  | ; PCL = PCL + ACC, the PCH can't be changed.          |
| JMP   | A0POINT | ; ACC = 0, jump to A0POINT                            |
| JMP   | A1POINT | ; ACC = 1, jump to A1POINT                            |
| JMP   | A2POINT | ; ACC = 2, jump to A2POINT                            |
| JMP   | A3POINT | ; ACC = 3, jump to A3POINT                            |

In following example, the jump table starts at 0x00FD. When execute B0ADD PCL, A. If ACC = 0 or 1, the jump table points to the right address. If the ACC is larger than 1 will cause error because PCH doesn't increase one automatically. We can see the PCL = 0 when ACC = 2 but the PCH still keep in 0. The program counter (PC) will point to a wrong address 0x0000 and crash system operation. It is important to check whether the jump table crosses over the boundary (xxFFH to xx00H). A good coding style is to put the jump table at the start of ROM boundary (e.g. 0100H).

➤ Example: If “jump table” crosses over ROM boundary will cause errors.

ROM Address

|        |       |         |  |
|--------|-------|---------|--|
| ...    |       |         |  |
| ...    |       |         |  |
| ...    |       |         |  |
| 0X00FD | B0ADD | PCL, A  | ; PCL = PCL + ACC, the PCH can't be changed. |
| 0X00FE | JMP   | A0POINT | ; ACC = 0                                    |
| 0X00FF | JMP   | A1POINT | ; ACC = 1                                    |
| 0X0100 | JMP   | A2POINT | ; ACC = 2 ← jump table cross boundary here   |
| 0X0101 | JMP   | A3POINT | ; ACC = 3                                    |
| ...    |       |         |  |
| ...    |       |         |  |

SONIX provides a macro for safe jump table function. This macro will check the ROM boundary and move the jump table to the right position automatically. The side effect of this macro maybe wastes some ROM size.

- Example: If “jump table” crosses over ROM boundary will cause errors.

```
@JMP_A      MACRO    VAL
IF          (($+1) !& 0xFF00) != (($+(VAL)) !& 0xFF00)
JMP         ($ | 0xFF)
ORG         ($ | 0xFF)
ENDIF
ADD         PCL, A
ENDM
```

\* Note: “VAL” is the number of the jump table listing number.

- Example: “@JMP\_A” application in SONIX macro file called “MACRO3.H”.

|        |         |   |
|--------|---------|---|
| B0MOV  | A, BUF0 | ; “BUF0” is from 0 to 4.                        |
| @JMP_A | 5       | ; The number of the jump table listing is five. |
| JMP    | A0POINT | ; ACC = 0, jump to A0POINT                      |
| JMP    | A1POINT | ; ACC = 1, jump to A1POINT                      |
| JMP    | A2POINT | ; ACC = 2, jump to A2POINT                      |
| JMP    | A3POINT | ; ACC = 3, jump to A3POINT                      |
| JMP    | A4POINT | ; ACC = 4, jump to A4POINT                      |

If the jump table position is across a ROM boundary (0x00FF~0x0100), the “@JMP\_A” macro will adjust the jump table routine begin from next RAM boundary (0x0100).

- Example: “@JMP\_A” operation.

; Before compiling program.

ROM address

|        |        |         |   |
|--------|--------|---------|---|
|        | B0MOV  | A, BUF0 | ; “BUF0” is from 0 to 4.                        |
|        | @JMP_A | 5       | ; The number of the jump table listing is five. |
| 0X00FD | JMP    | A0POINT | ; ACC = 0, jump to A0POINT                      |
| 0X00FE | JMP    | A1POINT | ; ACC = 1, jump to A1POINT                      |
| 0X00FF | JMP    | A2POINT | ; ACC = 2, jump to A2POINT                      |
| 0X0100 | JMP    | A3POINT | ; ACC = 3, jump to A3POINT                      |
| 0X0101 | JMP    | A4POINT | ; ACC = 4, jump to A4POINT                      |

; After compiling program.

ROM address

|        |        |         |   |
|--------|--------|---------|---|
|        | B0MOV  | A, BUF0 | ; “BUF0” is from 0 to 4.                        |
|        | @JMP_A | 5       | ; The number of the jump table listing is five. |
| 0X0100 | JMP    | A0POINT | ; ACC = 0, jump to A0POINT                      |
| 0X0101 | JMP    | A1POINT | ; ACC = 1, jump to A1POINT                      |
| 0X0102 | JMP    | A2POINT | ; ACC = 2, jump to A2POINT                      |
| 0X0103 | JMP    | A3POINT | ; ACC = 3, jump to A3POINT                      |
| 0X0104 | JMP    | A4POINT | ; ACC = 4, jump to A4POINT                      |

### 2.1.2.3 CHECKSUM CALCULATION

The last ROM address is reserved area. User should avoid these addresses (last address) when calculate the Checksum value.

- Example: The demo program shows how to calculated Checksum from 00H to the end of user's code.

```
MOV      A,#END_USER_CODE$L
B0MOV   END_ADDR1, A          ; Save low end address to end_addr1
MOV      A,#END_USER_CODE$M

## 2.1.3 CODE OPTION TABLE

| Code Option  | Content   | Function Description   |
|--------------|-----------|--|
| Watch_Dog    | Enable    | Enable Watchdog function (WDT work in Normal/slow Mode).                 |
|              | Disable   | Disable Watchdog function.   |
|              | Always On | Enable Watchdog function (WDT work in Normal/slow/Green/Sleep Mode).     |
| Security     | Enable    | Enable ROM code Security function.                                       |
|              | Disable   | Disable ROM code Security function.                                      |
| High_Clk     | IHRC      | High Speed Internal 4MHz RC, XIN/XOUT become to P2.0/P2.1 as IO function |
|              | IHRC_RTC  | High Speed Internal 4MHz RC, LXIN/LXOUT connect 32768 Crystal            |
| High_Clk_Div | Fhosc/4   | High clock Fcpu = IHRC/4 = 1MHz.   |
|              | Fhosc/8   | High clock Fcpu = IHRC/8 = 500kHz.                                       |
|              | Fhosc/16  | High clock Fcpu = IHRC/16 = 250kHz.                                      |
|              | Fhosc/32  | High clock Fcpu = IHRC/32 = 125kHz.                                      |

- \* Note1: In high noisy environment, set Watch\_Dog as "Always\_On" is strongly recommended.
- \* Note2: Fcpu code option is only available for High Clock. Fcpu of slow mode is Fosc/4.

## 2.1.4 DATA MEMORY (RAM)

### 2.1.5.2 SYSTEM REGISTER DESCRIPTION

L, H = Working, @LH and ROM addressing register

Y, Z = Working, @YZ and ROM addressing register

PFLAG = ROM Page and Special Flag Register

LCDM1 = LCD Mode Register

AMPM1 = PGIA mode selection register1

ADCM1 = ADC control register1

ADCM3 = ADC control register3

ADCDH = ADC high-byte data buffer

ADCDL = ADC low-byte data buffer

ROMADRH = ISP ROM address

ROMDAH = ISP ROM programming data buffer

ROMCNT = ISP ROM counter

P<sub>N</sub>UR = Port N pull-up register

P1W = Port 1 wakeup register

INTEN = Interrupt enable register

WDTR = Watchdog timer register

PCL, PCH = Program counter

T0C = Timer 0 counting register

T1C = Timer 1 counting register

TC0C = Timer/Counter 0 Counting register

@HL= RAM HL indirect addressing index pointer

@YZ= RAM YZ indirect addressing index pointer

STK0~STK7 = Stack 0 ~ stack 7 Buffer

R = Working register and ROM look-up data buffer

X = Working register and ROM look-up data buffer

RBANK = Bank selection register

LCDM2 = LCD mode register

VREG = Voltage Regulators control register

AMPM2 = PGIA mode selection register2

ADCM2 = ADC control register2

LBTM = Low Battery Detect Register

ADCDM = ADC medium-byte data buffer

LEDCPM = Charge Pump LED-regulator control register

ROMADRL = ISP ROM address

ROMDAL = ISP ROM programming data buffer

P<sub>N</sub>M = Port N input/output mode register

P<sub>N</sub> = Port N data buffer

INTRQ = Interrupt request register

OSCM = Oscillator mode register

TC0R = Timer/Counter 0 auto-reload data buffer

T0M = Timer 0 mode register

T1M = Timer 1 mode register

TC0M = Timer/Counter 0 mode register

STKP= Stack pointer buffer

### 2.1.5.3 BIT DEFINITION of SYSTEM REGISTER

| Address | Bit7    | Bit6     | Bit5     | Bit4     | Bit3     | Bit2     | Bit1     | Bit0    | R/W | Name    |

| 0FFH | -     | -     | -     | S0PC12 | S0PC11 | S0PC10 | S0PC9 | S0PC8 | R/W | STK0H |

\* Note:

1. To avoid system error, make sure to put all the “0” and “1” as it indicates in the above table.
2. All of register names had been declared in SN8ASM assembler.
3. One-bit name had been declared in SN8ASM assembler with “F” prefix code.
4. “b0bset”, “b0bclr”, “bset”, “bclr” instructions are only available to the “R/W” registers.

## 2.1.6 ACCUMULATOR

The ACC is an 8-bit data register responsible for transferring or manipulating data between ALU and data memory. If the result of operating is zero (Z) or there is carry (C or DC) occurrence, then these flags will be set to PFLAG register.

ACC is not in data memory (RAM), so ACC can't be access by "B0MOV" instruction during the instant addressing mode.

➤ **Example: Read and write ACC value.**

; Read ACC data and store in BUF data memory

MOV        BUF, A

; Write a immediate data into ACC

MOV        A, #0FH

; Write ACC data from BUF data memory

MOV        A, BUF

The system doesn't store ACC and PFLAG value when interrupt executed. ACC and PFLAG data must be saved to other data memories by program.

➤ **Example: Protect ACC and working registers.**

```
.DATA            ACCBUF    DS  1            ; Define ACCBUF for store ACC data.  
                PFLAGBUF  DS  1            ; Define PFLAGBUF for store PFLAG data.  
.CODE  
INT_SERVICE:  
    B0XCH        A, ACCBUF    ; Save ACC in a buffer.  
    B0MOV        A, PFLAG     ; Save PFLAG register in a buffer.  
    B0MOV        PFLAGBUF, A ; Save PFLAG register in a buffer.  
    ...  
    ...  
    B0MOV        A, PFLAGBUF ; Restore PFLAG register from buffer.  
    B0MOV        PFLAG, A     ; Restore ACC from buffer.  
    B0XCH        A, ACCBUF    ; Exit interrupt service vector  
    RETI
```

\* **Note:** To save and re-load ACC data, users must use "B0XCH" instruction, or else the PFLAG Register might be modified by ACC operation.

## 2.1.7 PROGRAM FLAG

The PFLAG register contains the arithmetic status of ALU operation, C, DC, Z bits indicate the result status of ALU operation.

| 086H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| PFLAG       | -     | -     | -     | -     | -     | C     | DC    | Z     |
| Read/Write  | -     | -     | -     | -     | -     | R/W   | R/W   | R/W   |
| After reset | -     | -     | -     | -     | -     | 0     | 0     | 0     |

- Bit 2      **C:** Carry flag  
               1 = Addition with carry, subtraction without borrowing, rotation with shifting out logic “1”, comparison result  $\geq 0$ .  
               0 = Addition without carry, subtraction with borrowing signal, rotation with shifting out logic “0”, comparison result  $< 0$ .
- Bit 1      **DC:** Decimal carry flag  
               1 = Addition with carry from low nibble, subtraction without borrow from high nibble.  
               0 = Addition without carry from low nibble, subtraction with borrow from high nibble.
- Bit 0      **Z:** Zero flag  
               1 = The result of an arithmetic/logic/branch operation is zero.  
               0 = The result of an arithmetic/logic/branch operation is not zero.

➤ \* **Note:** Refer to instruction set table for detailed information of C, DC and Z flags.

## 2.1.8 PROGRAM COUNTER

The program counter (PC) is a 13-bit binary counter separated into the high-byte 5 and the low-byte 8 bits. This counter is responsible for pointing a location in order to fetch an instruction for kernel circuit. Normally, the program counter is automatically incremented with each instruction during program execution.

Besides, it can be replaced with specific address by executing CALL or JMP instruction. When JMP or CALL instruction is executed, the destination address will be inserted to bit 0 ~ bit 12.

|             | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|--------|--------|--------|--------|--------|--------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| <b>PC</b>   | -      | -      | -      | PC12   | PC11   | PC10   | PC9   | PC8   | PC7   | PC6   | PC5   | PC4   | PC3   | PC2   | PC1   | PC0   |
| After reset | -      | -      | -      | 0      | 0      | 0      | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |
| PCH         |        |        |        |        |        |        |       |       |       | PCL   |       |       |       |       |       |       |

### ONE ADDRESS SKIPPING

There are nine instructions (CMPRS, INCS, INCMS, DECS, DECMS, BTS0, BTS1, B0BTS0, B0BTS1) with one address skipping function. If the result of these instructions is true, the PC will add 2 steps to skip next instruction.

**If the condition of bit test instruction is true, the PC will add 2 steps to skip next instruction.**

|               |         |                              |
|---------------|---------|------------------------------|
| <b>B0BTS1</b> | FC      | ; To skip, if Carry_flag = 1 |
| JMP           | C0STEP  | ; Else jump to C0STEP.       |
| ...           |         |                              |
| C0STEP:       | NOP     |                              |
|               |         |                              |
| <b>B0MOV</b>  | A, BUF0 | ; Move BUF0 value to ACC.    |
| <b>B0BTS0</b> | FZ      | ; To skip, if Zero flag = 0. |
| JMP           | C1STEP  | ; Else jump to C1STEP.       |
| ...           |         |                              |
| C1STEP:       | NOP     |                              |

**If the ACC is equal to the immediate data or memory, the PC will add 2 steps to skip next instruction.**

|              |         |                          |
|--------------|---------|--------------------------|
| <b>CMPRS</b> | A, #12H | ; To skip, if ACC = 12H. |
| JMP          | C0STEP  | ; Else jump to C0STEP.   |
| ...          |         |                          |
| C0STEP:      | NOP     |                          |

**If the destination increased by 1, which results overflow of 0xFF to 0x00, the PC will add 2 steps to skip next instruction.**

**INCS instruction:**

|         |             |        |                                      |
|---------|-------------|--------|--------------------------------------|
|         | <b>INCS</b> | BUF0   |                                      |
|         | JMP         | C0STEP | ; Jump to C0STEP if ACC is not zero. |
|         | ...         |        |                                      |
|         | ...         |        |                                      |
| C0STEP: | NOP         |        |                                      |

**INCMS instruction:**

|         |              |        |                                       |
|---------|--------------|--------|---------------------------------------|
|         | <b>INCMS</b> | BUF0   |                                       |
|         | JMP          | C0STEP | ; Jump to C0STEP if BUF0 is not zero. |
|         | ...          |        |                                       |
|         | ...          |        |                                       |
| C0STEP: | NOP          |        |                                       |

**If the destination decreased by 1, which results underflow of 0x01 to 0x00, the PC will add 2 steps to skip next instruction.**

**DECS instruction:**

|         |             |        |                                      |
|---------|-------------|--------|--------------------------------------|
|         | <b>DECS</b> | BUF0   |                                      |
|         | JMP         | C0STEP | ; Jump to C0STEP if ACC is not zero. |
|         | ...         |        |                                      |
|         | ...         |        |                                      |
| C0STEP: | NOP         |        |                                      |

**DECMS instruction:**

|         |              |        |                                       |
|---------|--------------|--------|---------------------------------------|
|         | <b>DECMS</b> | BUF0   |                                       |
|         | JMP          | C0STEP | ; Jump to C0STEP if BUF0 is not zero. |
|         | ...          |        |                                       |
|         | ...          |        |                                       |
| C0STEP: | NOP          |        |                                       |

## ➤ MULTI-ADDRESS JUMPING

Users can jump around the multi-address by either JMP instruction or ADD M, A instruction (M = PCL) to activate multi-address jumping function. Program counter can't carry to PCH when PCL overflow automatically after executing addition instructions. Users have to take care program counter result and adjust PCH value by program. For jump table or others applications, users have to calculate PC value to avoid PCL overflow making PC error and program executing error.

\* **Note:** Program counter can't carry to PCH when PCL overflow automatically after executing addition instructions. Users have to take care program counter result and adjust PCH value by program.

### ➤ Example: If PC = 0323H (PCH = 03H, PCL = 23H)

; PC = 0323H

|       |         |                         |
|-------|---------|-------------------------|
| MOV   | A, #28H |                         |
| B0MOV | PCL, A  | ; Jump to address 0328H |
| ...   |         |                         |

; PC = 0328H

|       |         |                         |
|-------|---------|-------------------------|
| MOV   | A, #00H |                         |
| B0MOV | PCL, A  | ; Jump to address 0300H |
| ...   |         |                         |

### ➤ Example: If PC = 0323H (PCH = 03H, PCL = 23H)

; PC = 0323H

|       |         |   |
|-------|---------|---|
| B0ADD | PCL, A  | ; PCL = PCL + ACC, the PCH cannot be changed. |
| JMP   | A0POINT | ; If ACC = 0, jump to A0POINT                 |
| JMP   | A1POINT | ; ACC = 1, jump to A1POINT                    |
| JMP   | A2POINT | ; ACC = 2, jump to A2POINT                    |
| JMP   | A3POINT | ; ACC = 3, jump to A3POINT                    |
| ...   |         |   |
| ...   |         |   |

## Y, Z REGISTERS

The Y and Z registers are the 8-bit buffers. There are three major functions of these registers.

- can be used as general working registers
- can be used as RAM data pointers with @YZ register
- can be used as ROM data pointer with the MOVC instruction for look-up table

| 084H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| Y           | YBIT7 | YBIT6 | YBIT5 | YBIT4 | YBIT3 | YBIT2 | YBIT1 | YBIT0 |
| Read/Write  | R/W   |
| After reset | -     | -     | -     | -     | -     | -     | -     | -     |

| 083H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| Z           | ZBIT7 | ZBIT6 | ZBIT5 | ZBIT4 | ZBIT3 | ZBIT2 | ZBIT1 | ZBIT0 |
| Read/Write  | R/W   |
| After reset | -     | -     | -     | -     | -     | -     | -     | -     |

➤ Example: Uses Y, Z register as the data pointer to access data in the RAM address 025H of bank0.

```
B0MOV    Y, #00H      ; To set RAM bank 0 for Y register
B0MOV    Z, #25H      ; To set location 25H for Z register
B0MOV    A, @YZ       ; To read a data into ACC
```

➤ Example: Uses the Y, Z register as data pointer to clear the RAM data.

```
B0MOV    Y, #0          ; Y = 0, bank 0
B0MOV    Z, #07FH      ; Z = 7FH, the last address of the data memory area
```

CLR\_YZ\_BUF:

```
CLR     @YZ           ; Clear @YZ to be zero
DECMS
JMP     Z              ; Z - 1, if Z= 0, finish the routine
                  CLR_YZ_BUF ; Not zero
```

END\_CLR:

```
CLR     @YZ           ; End of clear general purpose data memory area of bank 0
...
```

## 2.1.9 R REGISTERS

R register is an 8-bit buffer. There are two major functions of the register.

- Can be used as working register
- For store high-byte data of look-up table

(MOVC instruction executed, the high-byte data of specified ROM address will be stored in R register and the low-byte data will be stored in ACC).

| 082H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| R           | RBIT7 | RBIT6 | RBIT5 | RBIT4 | RBIT3 | RBIT2 | RBIT1 | RBIT0 |
| Read/Write  | R/W   |
| After reset | -     | -     | -     | -     | -     | -     | -     | -     |

\* **Note:** Please refer to the “LOOK-UP TABLE DESCRIPTION” about R register look-up table application.

## 2.2 ADDRESSING MODE

### 2.2.1 IMMEDIATE ADDRESSING MODE

The immediate addressing mode uses an immediate data to set up the location in ACC or specific RAM.

- Example: Move the immediate data 12H to ACC.

MOV A, #12H ; To set an immediate data 12H into ACC.

- Example: Move the immediate data 12H to R register.

B0MOV R, #12H ; To set an immediate data 12H into R register.

\* Note: In immediate addressing mode application, the specific RAM must be 0x80~0x87 working register.

### 2.2.2 DIRECTLY ADDRESSING MODE

The directly addressing mode moves the content of RAM location in or out of ACC.

Example: Move 0x12 RAM location data into ACC.

B0MOV A, 12H ; To get a content of RAM location 0x12 of bank 0 and save in ACC.

Example: Move ACC data into 0x12 RAM location.

B0MOV 12H, A ; To get a content of ACC and save in RAM location 12H of bank 0.

### 2.2.3 INDIRECTLY ADDRESSING MODE

The indirectly addressing mode is to access the memory by the data pointer registers (Y/Z).

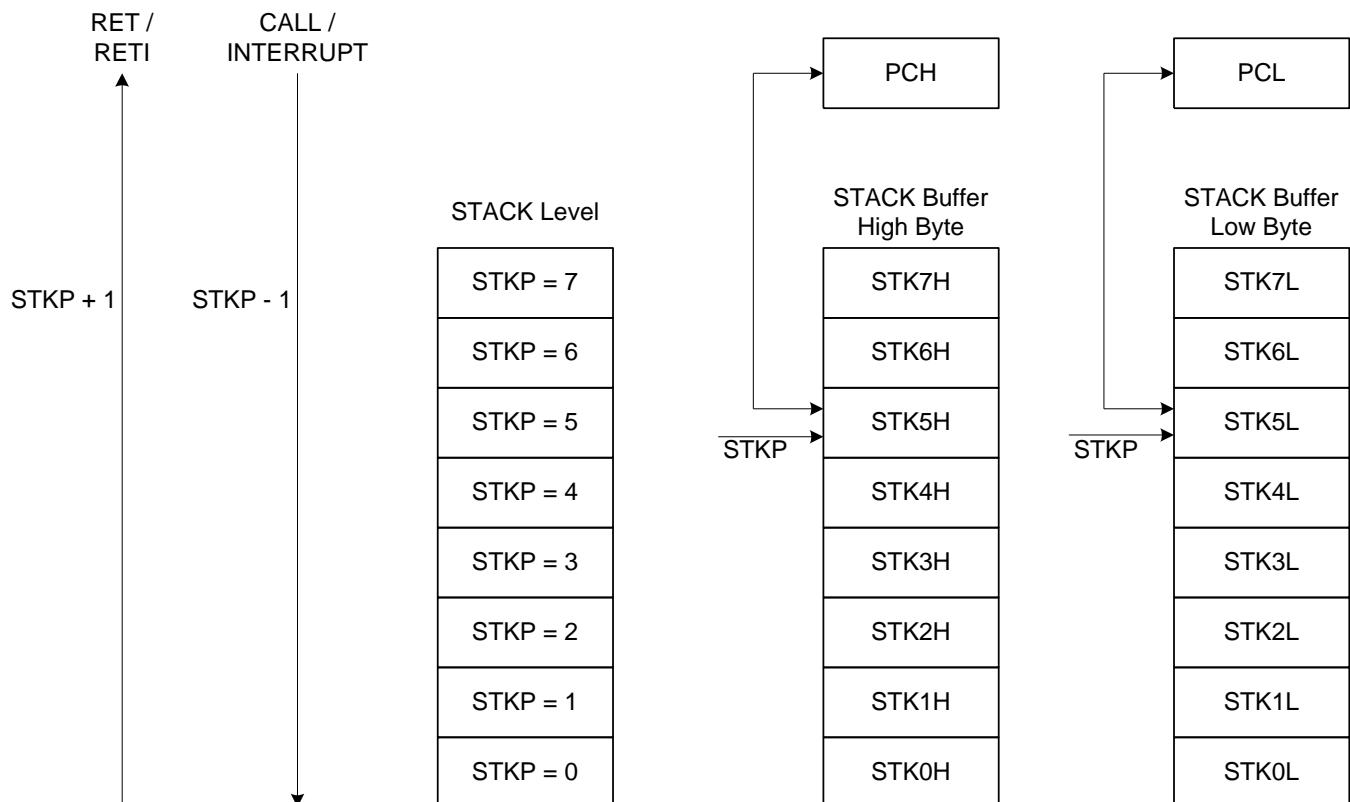

- Example: Indirectly addressing mode with @YZ register.

|               |  |
|---------------|--|
| B0MOV Y, #0   | ; To clear Y register to access RAM bank 0.                          |
| B0MOV Z, #12H | ; To set an immediate data 12H into Z register.                      |
| B0MOV A, @YZ  | ; Use data pointer @YZ reads a data from RAM location 012H into ACC. |

## 2.3 STACK OPERATION

### 2.3.1 OVERVIEW

The stack buffer has 8-level. These buffers are designed to push and pop up program counter's (PC) data when interrupt service routine and "CALL" instruction are executed. The STKP register is a pointer designed to point active level in order to push or pop up data from stack buffer. The STKnH and STKnL are the stack buffers to store program counter (PC) data.

## 2.3.2 STACK REGISTERS

The stack pointer (STKP) is a 3-bit register to store the address used to access the stack buffer, 11-bit data memory (STKnH and STKnL) set aside for temporary storage of stack addresses.

The two stack operations are writing to the top of the stack (push) and reading from the top of stack (pop). Push operation decrements the STKP and the pop operation increments each time. That makes the STKP always point to the top address of stack buffer and write the last program counter value (PC) into the stack buffer.

The program counter (PC) value is stored in the stack buffer before a CALL instruction executed or during interrupt service routine. Stack operation is a LIFO type (Last in and first out). The stack pointer (STKP) and stack buffer (STKnH and STKnL) are located in the system register area bank 0.

| 0DFH        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2  | Bit 1  | Bit 0  |
|-------------|-------|-------|-------|-------|-------|--------|--------|--------|
| <b>STKP</b> | GIE   | -     | -     | -     | -     | STKPB2 | STKPB1 | STKPB0 |
| Read/Write  | R/W   | -     | -     | -     | -     | R/W    | R/W    | R/W    |
| After reset | 0     | -     | -     | -     | -     | 1      | 1      | 1      |

Bit[2:0] **STKPBn**: Stack pointer (n = 0 ~ 2)

Bit 7 **GIE**: Global interrupt control bit.

0 = Disable.

1 = Enable. Please refer to the interrupt chapter.

- Example: Stack pointer (STKP) reset, we strongly recommended to clear the stack pointer in the beginning of the program.

```
MOV      A, #01111111B
B0MOV    STKP, A
```

| 0F0H~0FFH    | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2  | Bit 1 | Bit 0 |

**STKn = STKnH, STKnL (n = 7 ~ 0)**

### 2.3.3 STACK OPERATION EXAMPLE

The two kinds of Stack-Save operations refer to the stack pointer (STKP) and write the content of program counter (PC) to the stack buffer are CALL instruction and interrupt service. Under each condition, the STKP decreases and points to the next available stack location. The stack buffer stores the program counter about the op-code address. The Stack-Save operation is as the following table.

| Stack Level | STKP Register |        |        | Stack Buffer |          | Description       |
|-------------|---------------|--------|--------|--------------|----------|-------------------|
|             | STKPB2        | STKPB1 | STKPB0 | High Byte    | Low Byte |                   |
| 0           | 1             | 1      | 1      | Free         | Free     | -                 |
| 1           | 1             | 1      | 0      | STK0H        | STK0L    | -                 |
| 2           | 1             | 0      | 1      | STK1H        | STK1L    | -                 |
| 3           | 1             | 0      | 0      | STK2H        | STK2L    | -                 |
| 4           | 0             | 1      | 1      | STK3H        | STK3L    | -                 |
| 5           | 0             | 1      | 0      | STK4H        | STK4L    | -                 |
| 6           | 0             | 0      | 1      | STK5H        | STK5L    | -                 |
| 7           | 0             | 0      | 0      | STK6H        | STK6L    | -                 |
| 8           | 1             | 1      | 1      | STK7H        | STK7L    | -                 |
| > 8         | 1             | 1      | 0      | -            | -        | Stack Over, error |

There are Stack-Restore operations correspond to each push operation to restore the program counter (PC). The RETI instruction uses for interrupt service routine. The RET instruction is for CALL instruction. When a pop operation occurs, the STKP is incremented and points to the next free stack location. The stack buffer restores the last program counter (PC) to the program counter registers. The Stack-Restore operation is as the following table.

| Stack Level | STKP Register |        |        | Stack Buffer |          | Description |
|-------------|---------------|--------|--------|--------------|----------|-------------|
|             | STKPB2        | STKPB1 | STKPB0 | High Byte    | Low Byte |             |
| 8           | 1             | 1      | 1      | STK7H        | STK7L    | -           |
| 7           | 0             | 0      | 0      | STK6H        | STK6L    | -           |
| 6           | 0             | 0      | 1      | STK5H        | STK5L    | -           |
| 5           | 0             | 1      | 0      | STK4H        | STK4L    | -           |
| 4           | 0             | 1      | 1      | STK3H        | STK3L    | -           |
| 3           | 1             | 0      | 0      | STK2H        | STK2L    | -           |
| 2           | 1             | 0      | 1      | STK1H        | STK1L    | -           |
| 1           | 1             | 1      | 0      | STK0H        | STK0L    | -           |

# 3 RESET

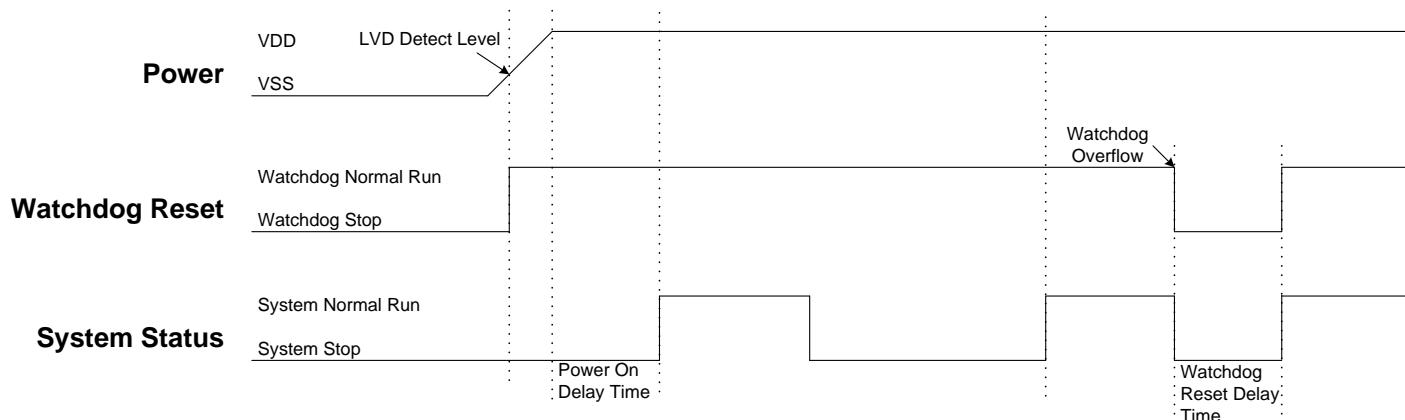

## 3.1 OVERVIEW

The system would be reset in three conditions as following.

- Power on reset
- Watchdog reset
- Brown out reset

When any reset condition occurs, all system registers keep initial status, program stops and program counter is cleared. After reset status released, the system boots up and program starts to execute from ORG 0.

Finishing any reset sequence needs some time. The system provides complete procedures to make the power on reset successful. For different oscillator types, the reset time is different. That causes the VDD rise rate and start-up time of different oscillator is not fixed. RC type oscillator's start-up time is very short, but the crystal type is longer. Under client terminal application, users have to take care the power on reset time for the master terminal requirement. The reset timing diagram is as following.

## 3.2 POWER ON RESET

The power on reset depend no LVD operation for most power-up situations. The power supplying to system is a rising curve and needs some time to achieve the normal voltage. Power on reset sequence is as following.

- **Power-up:** System detects the power voltage up and waits for power stable.
- **System initialization:** All system registers is set as initial conditions and system is ready.
- **Oscillator warm up:** Oscillator operation is successfully and supply to system clock.
- **Program executing:** Power on sequence is finished and program executes from ORG 0.

### 3.3 WATCHDOG RESET

Watchdog reset is a system protection. In normal condition, system works well and clears watchdog timer by program. Under error condition, system is in unknown situation and watchdog can't be clear by program before watchdog timer overflow. Watchdog timer overflow occurs and the system is reset. After watchdog reset, the system restarts and returns normal mode. Watchdog reset sequence is as following.

- **Watchdog timer status:** System checks watchdog timer overflow status. If watchdog timer overflow occurs, the system is reset.
- **System initialization:** All system registers is set as initial conditions and system is ready.
- **Oscillator warm up:** Oscillator operation is successfully and supply to system clock.
- **Program executing:** Power on sequence is finished and program executes from ORG 0.

Watchdog timer application note is as following.

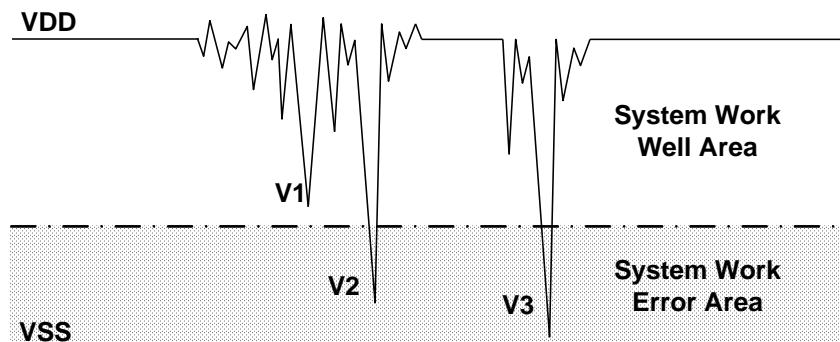

- Before clearing watchdog timer, check I/O status and check RAM contents can improve system error.
- Don't clear watchdog timer in interrupt vector and interrupt service routine. That can improve main routine fail.
- Clearing watchdog timer program is only at one part of the program. This way is the best structure to enhance the watchdog timer function.

\* **Note:** Please refer to the “WATCHDOG TIMER” about watchdog timer detail information.

### 3.4 BROWN OUT RESET

#### 3.4.1 BROWN OUT DESCRIPTION

The brown out reset is a power dropping condition. The power drops from normal voltage to low voltage by external factors (e.g. EFT interference or external loading changed). The brown out reset would make the system not work well or executing program error.

Brown Out Reset Diagram

The power dropping might through the voltage range that's the system dead-band. The dead-band means the power range can't offer the system minimum operation power requirement. The above diagram is a typical brown out reset diagram. There is a serious noise under the VDD, and VDD voltage drops very deep. There is a dotted line to separate the system working area. The above area is the system work well area. The below area is the system work error area called dead-band. V1 doesn't touch the below area and not effect the system operation. But the V2 and V3 is under the below area and may induce the system error occurrence. Let system under dead-band includes some conditions.

##### DC application:

The power source of DC application is usually using battery. When low battery condition and MCU drive any loading, the power drops and keeps in dead-band. Under the situation, the power won't drop deeper and not touch the system reset voltage. That makes the system under dead-band.

##### AC application:

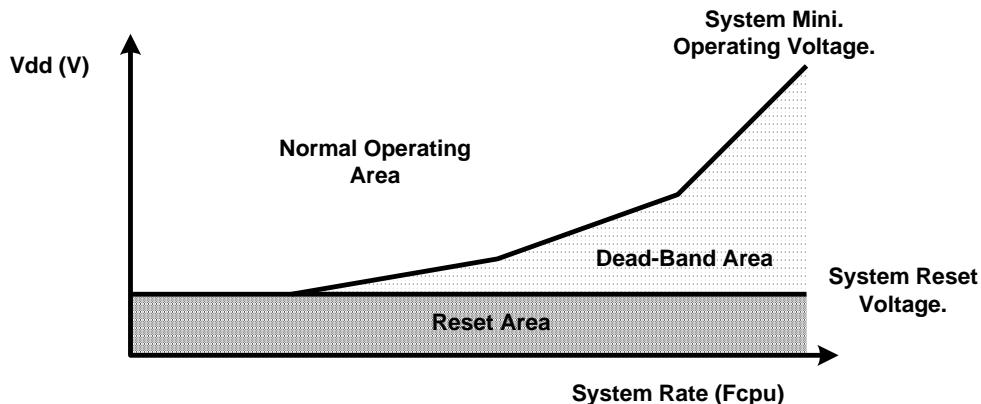

In AC power application, the DC power is regulated from AC power source. This kind of power usually couples with AC noise that makes the DC power dirty. Or the external loading is very heavy, e.g. driving motor. The loading operating

induces noise and overlaps with the DC power. VDD drops by the noise, and the system works under unstable power situation.

The power on duration and power down duration are longer in AC application. The system power on sequence protects the power on successful, but the power down situation is like DC low battery condition. When turn off the AC power, the VDD drops slowly and through the dead-band for a while.

### 3.4.2 THE SYSTEM OPERATING VOLTAGE DESCRIPTION

To improve the brown out reset needs to know the system minimum operating voltage which is depend on the system executing rate and power level. Different system executing rates have different system minimum operating voltage. The electrical characteristic section shows the system voltage to executing rate relationship.

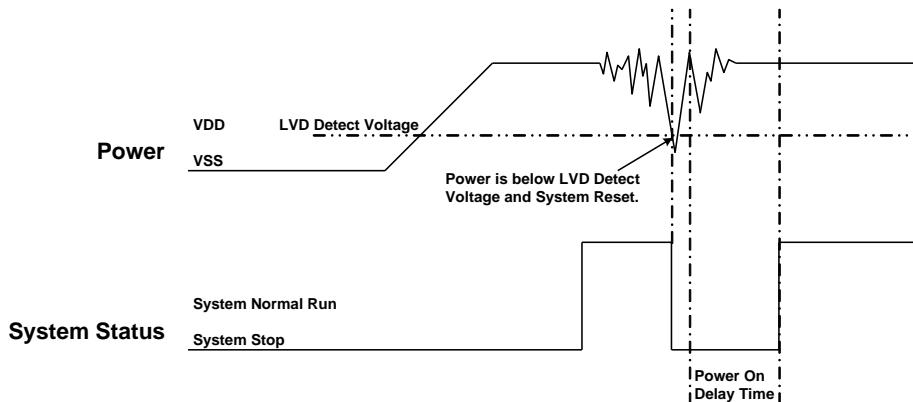

Normally the system operation voltage area is higher than the system reset voltage to VDD, and the reset voltage is decided by LVD detect level. The system minimum operating voltage rises when the system executing rate upper even higher than system reset voltage. The dead-band definition is the system minimum operating voltage above the system reset voltage.

### 3.4.3 BROWN OUT RESET IMPROVEMENT

**How to improve the brown out reset condition?** There are some methods to improve brown out reset as following.

- LVD reset
- Watchdog reset
- Reduce the system executing rate

**LVD reset:**

The LVD (low voltage detector) is built-in Sonix 8-bit MCU to be brown out reset protection. When the VDD drops and is below LVD detect voltage, the LVD would be triggered, and the system is reset. The LVD detect level is different by each MCU. The LVD voltage level is a point of voltage and not easy to cover all dead-band range. Using LVD to improve brown out reset is depend on application requirement and environment. If the power variation is very deep, violent and trigger the LVD, the LVD can be the protection. If the power variation can touch the LVD detect level and make system work error, the LVD can't be the protection and need to other reset methods. More detail LVD information is in the electrical characteristic section.

**Watchdog reset:**

The watchdog timer is a protection to make sure the system executes well. Normally the watchdog timer would be clear at one point of program. Don't clear the watchdog timer in several addresses. The system executes normally and the watchdog won't reset system. When the system is under dead-band and the execution error, the watchdog timer can't be clear by program. The watchdog is continuously counting until overflow occurrence. The overflow signal of watchdog timer triggers the system to reset, and the system return to normal mode after reset sequence. This method also can improve brown out reset condition and make sure the system to return normal mode.

If the system reset by watchdog and the power is still in dead-band, the system reset sequence won't be successful and the system stays in reset status until the power return to normal range.

**Reduce the system executing rate:**

If the system rate is fast and the dead-band exists, to reduce the system executing rate can improve the dead-band. The lower system rate is with lower minimum operating voltage. Select the power voltage that's no dead-band issue and find out the mapping system rate. Adjust the system rate to the value and the system exits the dead-band issue. This way needs to modify whole program timing to fit the application requirement.

# 4 SYSTEM CLOCK

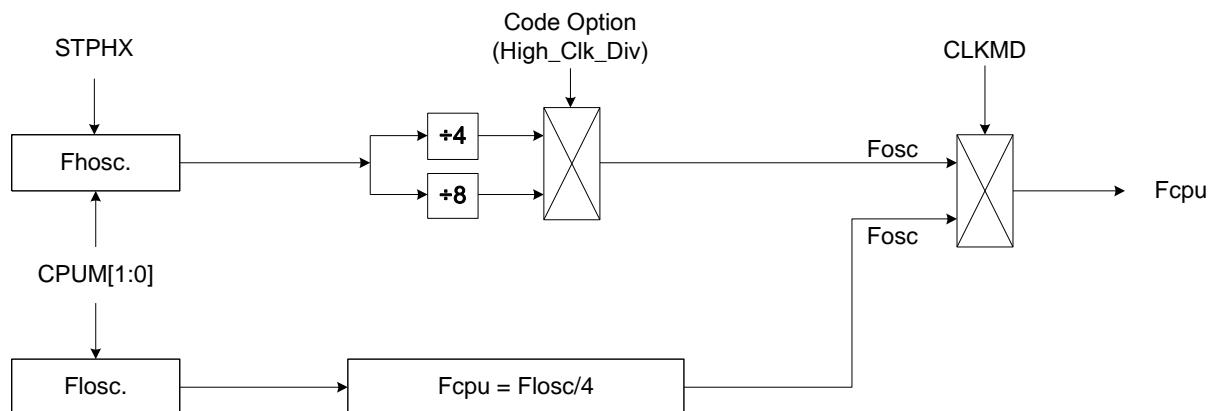

## 4.1 OVERVIEW

The micro-controller is a dual clock system. There are high-speed clock and low-speed clock. The high-speed clock is only generated from internal 4MHz high-speed RC oscillator circuit (IHRC 4MHz). The low-speed clock is generated from internal RC oscillator circuit or external 32768Hz Crystal.

Both the high-speed clock and the low-speed clock can be system clock (Fosc). The system clock in slow mode is divided by 4 to be the instruction cycle (Fcpu).

- ☞ **Normal Mode (High Clock):**  $F_{cpu} = F_{osc} / 4 = 1\text{MHz}$ . ( $F_{osc} = 4\text{MHz}$  IHRC)  
 $F_{cpu} = F_{osc} / 8 = 500\text{ kHz}$ . ( $F_{osc} = 4\text{MHz}$  IHRC)  
 $F_{cpu} = F_{osc} / 16 = 250\text{ kHz}$ . ( $F_{osc} = 4\text{MHz}$  IHRC)  
 $F_{cpu} = F_{osc} / 32 = 125\text{ kHz}$ . ( $F_{osc} = 4\text{MHz}$  IHRC)
- ☞ **Slow Mode (Low Clock):**  $F_{cpu} = F_{osc}/4$ . ( $F_{osc} = 32768\text{Hz}$  or ILRC)

## 4.2 CLOCK BLOCK DIAGRAM

- Fosc: System high clock source is from internal high RC (IHRC).
- Fosc: System low clock source is from internal low RC (ILRC) or external 32k due to Code Option setting.
- Fosc: System clock source.
- Fcpu: Instruction cycle.

## 4.3 OSCM REGISTER

The OSCM register is an oscillator control register. It controls oscillator status, system mode.

| 0CAH        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| <b>OSCM</b> | -     | -     | -     | CPUM1 | CPUM0 | CLKMD | STPHX | -     |
| Read/Write  | -     | -     | -     | R/W   | R/W   | R/W   | R/W   | -     |
| After reset | -     | -     | -     | 0     | 0     | 0     | 0     | -     |

- Bit 1      **STPHX:** External high-speed oscillator control bit.  
 0 = IHRC free run.  
 1 = IHRC free run stop. Internal low-speed RC oscillator is still running.
- Bit 2      **CLKMD:** System high/Low clock mode control bit.  
 0 = Normal (dual) mode. System clock is high clock.  
 1 = Slow mode. System clock is internal low clock if code option is IHRC. System clock is external 32k if code option is IHRC\_RTC.
- Bit[4:3]    **CPUM[1:0]:** CPU operating mode control bits.  
 00 = normal.  
 01 = sleep (power down) mode.  
 10 = green mode.  
 11 = reserved.

➤ **Example: Stop high-speed oscillator**

B0BSET      FSTPHX ; To stop IHRC only.

➤ **Example: When entering the power down mode (sleep mode), both high-speed oscillator and internal low-speed oscillator will be stopped.**

B0BSET      FCPUM0 ; To stop IHRC and internal low-speed oscillator called power down mode (sleep mode).

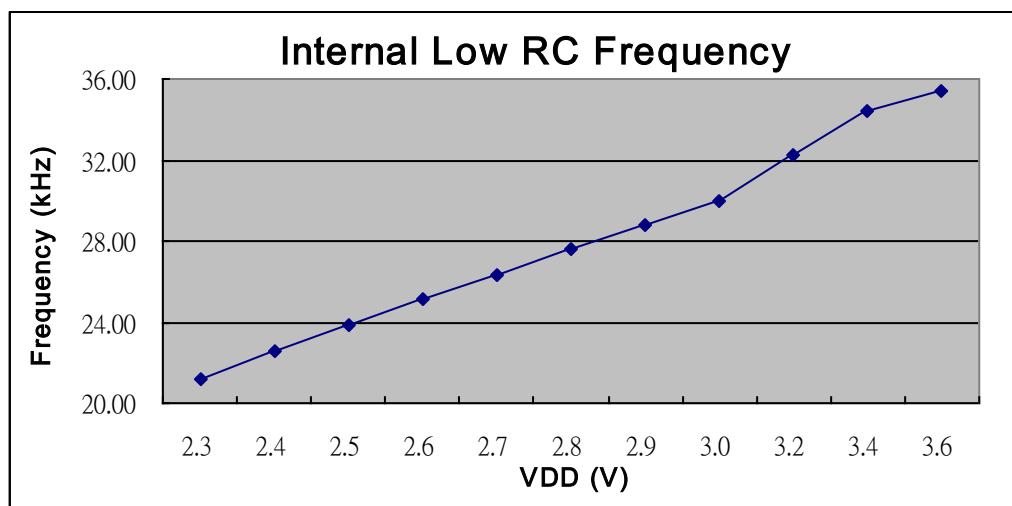

## 4.4 SYSTEM HIGH CLOCK

The system high clock is only from internal 4MHz oscillator RC type (IHRC). The system clock in normal mode is divided by 4 or 8, controlled by “High\_Clk\_Div of code option”, to be the instruction cycle (Fcpu).

## 4.5 SYSTEM LOW CLOCK

The system low clock source is only from internal RC oscillator (ILRC).The system clock in slow mode is divided by 4 to be the instruction cycle (Fcpu).

The system low clock source is the internal low-speed oscillator built in the micro-controller. The low-speed oscillator uses RC type oscillator circuit. The frequency is affected by the voltage and temperature of the system. In common condition, the frequency of the RC oscillator is about 32 KHz at 3.2V. The relation between the RC frequency and voltage is as the following figure.

The internal low RC supports watchdog clock source and system slow mode controlled by CLKMD.

☞ **Fosc = Internal low RC oscillator (about 32KHz@3.2V).**

☞ **Slow mode Fcpu = Fosc / 4**

The only one condition to stop ILRC is the system into power down mode with watchdog disable or enable. If watchdog set “Always\_On” and system into power down mode, the ILRC actives well and system will be reset until watchdog overflow occurring.

➤ **Example: Stop internal low-speed oscillator by power down mode.**

B0BSET      FCPUM0      ; To stop IHRC and ILRC or 32k crystal called power down mode  
; (sleep mode).

➤ \* **Note: The internal low-speed clock can't be turned off individually. It is controlled by CPUM0, CPUM1 bits of OSCM register.**

#### 4.5.1 SYSTEM CLOCK MEASUREMENT

Under design period, the users can measure system clock speed by software instruction cycle (Fcpu). This way is useful in RC mode.

- **Example: Fcpu instruction cycle of external oscillator.**

B0BSET P1M.0 ; Set P1.0 to be output mode for outputting Fcpu toggle signal.

@@:

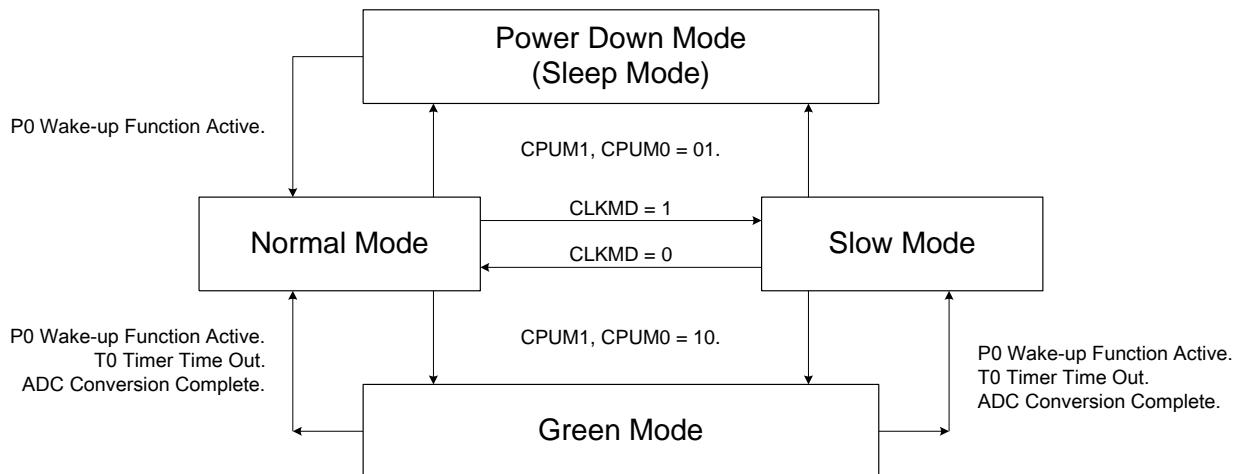

B0BSET P1.0 ; Output Fcpu toggle signal in low-speed clock mode.  
B0BCLR P1.0 ; Measure the Fcpu frequency by oscilloscope.  
JMP @B

# 5 SYSTEM OPERATION MODE

## 5.1 OVERVIEW

The chip is featured with low power consumption by switching around four different modes as following.

- Normal mode (High-speed mode)
- Slow mode (Low-speed mode)
- Power-down mode (Sleep mode)
- Green mode

System Mode Switching Diagram

### Operating mode description

| MODE               | NORMAL                   | SLOW                     | GREEN                         | POWER DOWN (SLEEP)       | REMARK  |

## 5.2 SYSTEM MODE SWITCHING

- Example: Switch normal/slow mode to power down (sleep) mode.

B0BSET            FCPUM0            ; Set CPUM0 = 1.

➤ \* Note: During the sleep, only the wakeup pin and reset can wakeup the system back to the normal mode.

- Example: Switch normal mode to slow mode.

B0BSET            FCLKMD            ;To set CLKMD = 1, Change the system into slow mode  
B0BSET            FSTPHX            ;To stop external high-speed oscillator for power saving.

- Example: Switch slow mode to normal mode (The IHRC oscillator is still running)

B0BCLR            FCLKMD            ;To set CLKMD = 0

- Example: Switch slow mode to normal mode (The IHRC oscillator stops)

If internal high clock stop and program want to switch back normal mode. It is necessary to delay at least 20ms for external clock stable.

B0BCLR            FSTPHX            ; Turn on the IHRC oscillator.  
@@:                B0MOV            Z, #54            ; If VDD = 3.2V, ILRC =32KHz (typical) will delay  
                DECMS            Z                    ; 0.125ms X 162 = 20.25ms for external clock stable  
                JMP              @B  
B0BCLR            FCLKMD            ; Change the system back to the normal mode

- Example: Switch normal/slow mode to green mode.

B0BSET            FCPUM1            ; Set CPUM1 = 1.

➤ \* Note: If T0 timer wakeup function is disabled in the green mode, the wakeup pin P0 can wakeup the system backs to the previous operation mode.

➤ Example: Switch normal/slow mode to Green mode and enable T0 wakeup function.

; Set T0 timer wakeup function.

|        |        |   |
|--------|--------|---|
| B0BCLR | FT0IEN | ; To disable T0 interrupt service                             |
| B0BCLR | FT0ENB | ; To disable T0 timer   |
| MOV    | A,#20H | ;   |
| B0MOV  | T0M,A  | ; To set T0 clock = Fcpu / 64                                 |
| MOV    | A,#74H | ;   |
| B0MOV  | T0C,A  | ; To set T0C initial value = 74H (To set T0 interval = 10 ms) |
| <br>   |        |   |
| B0BCLR | FT0IEN | ; To disable T0 interrupt service                             |
| B0BCLR | FT0IRQ | ; To clear T0 interrupt request                               |
| B0BSET | FT0ENB | ; To enable T0 timer  |

; Go into green mode

|        |        |                     |
|--------|--------|---------------------|
| B0BCLR | FCPUM0 | ; To set CPUMx = 10 |
| B0BSET | FCPUM1 |                     |

➤ \* **Note:** During the green mode with T0 wake-up function, the wakeup pins and T0 can wakeup the system back to the last mode. T0 wake-up period is controlled by program and T0ENB must be set.

➤ Example: Switch normal/slow mode to Green mode and enable ADC wakeup function.

; Set ADC timer wakeup function.

|        |              |   |
|--------|--------------|---|
| MOV    | A,#11111111b |   |
| B0MOV  | VREG,A       | ; To Turn On all analog voltage regulators. |
| MOV    | A,#00000111b |   |
| B0MOV  | AMPM1,A      | ; To Set PGIA function.                     |
| B0BSET | FADCENB      | ; To enable ADC Function                    |

; Go into green mode with high clock running

|        |        |                    |
|--------|--------|--------------------|
| B0BSET | FCPUM1 | ; To set CPUM0 = 1 |
|--------|--------|--------------------|

➤ \* **Note\_1:** when system into green mode with conditions of ADC function enable and high clock still running, the system will be wakeup when ADC conversion complete.  
\* **Note\_2:** The ADC green mode wakeup function is disable when ADCENB=0 or stop high clock (STPHX=1) is set before into green mode.

## 5.3 WAKEUP

### 5.3.1 OVERVIEW

Under power down mode (sleep mode) or green mode, program doesn't execute. The wakeup trigger can wake the system up to normal mode or slow mode. The wakeup trigger sources are external trigger (P0 level change) and internal trigger (T0 timer overflow and ADC conversion complete).

- Power down mode is waked up to normal mode. The wakeup trigger is only external trigger (P0 level change)
- Green mode is waked up to last mode (normal mode or slow mode). The wakeup triggers are external trigger (P0 level change) and internal trigger (T0 timer overflow and ADC conversion complete).

### 5.3.2 WAKEUP TIME

When the system is in power down mode (sleep mode), the high clock oscillator stops. When waked up from power down mode, MCU waits for 64 internal high-speed RC oscillator (IHRC) clocks as the wakeup time to stable the oscillator circuit. After the wakeup time, the system goes into the normal mode.

- \* **Note: Wakeup from green mode is no wakeup time because the clock doesn't stop in green mode.**

The value of the power down wakeup time is as the following.

$$\text{The Wakeup time} = 1/F_{Hosc} * 64 \text{ (sec)} + \text{high clock start-up time}$$

- \* **Note: The high clock start-up time is depended on the VDD. In general, high clock start-up time will be several micro-second (us) at VDD=3V.**

- Example: The system is waked up from power down (sleep mode) by P0 level change. After the wakeup time, the system goes into normal mode. The wakeup time is as the following.

$$\begin{aligned} \text{The wakeup time} &= 1/F_{Hosc} * 64 = 16\mu s \quad (F_{Hosc} = 4\text{MHz}) \\ \text{The total wakeup time} &= 16\mu s + \text{oscillator start-up time} (5\mu s) \end{aligned}$$

### 5.3.3 P0W WAKEUP CONTROL REGISTER

Under power down mode (sleep mode) and green mode, the I/O ports with wakeup function are able to wake the system up to normal mode. The Port 0 has wakeup function. The Port 0 wakeup function always is controlled by the P0W register.

| 0C0H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|

| Read/Write  | W     | W     | W     | W     | W     | W     | W     | W     |
| After reset | 1     | 1     | 1     | 1     | 1     | 1     | 1     | 1     |

Bit[7:0] **P00W~P07W:** Port 0 wakeup function control bits.

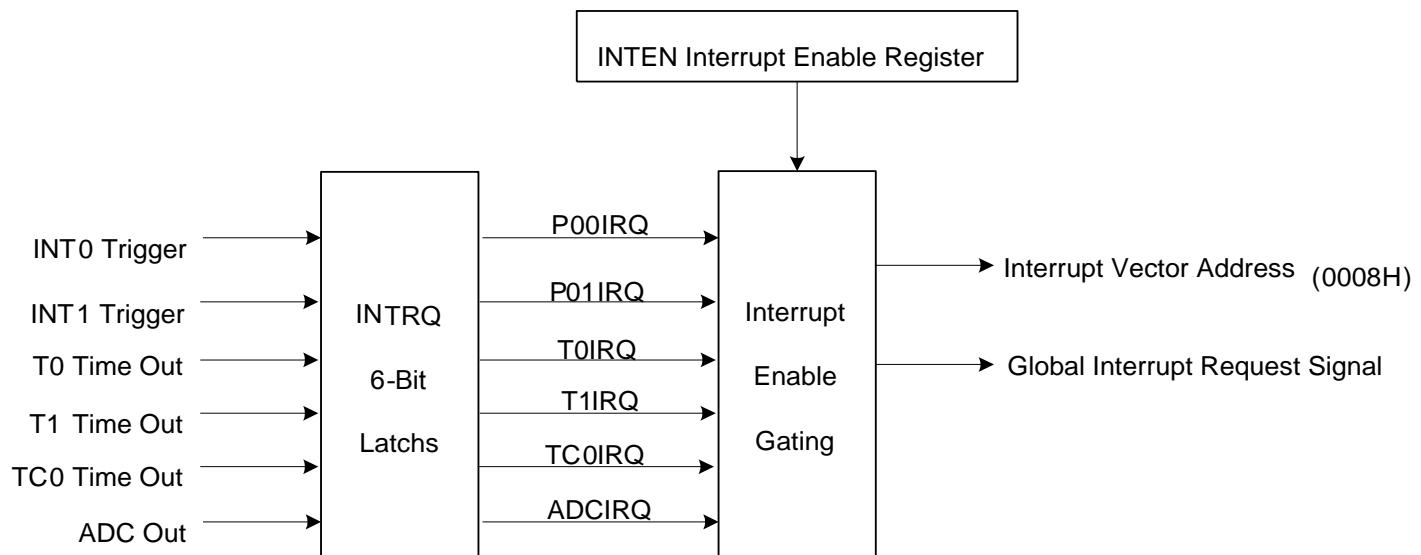

0 = Disable P0n wakeup function.

1 = Enable P0n wakeup function.

# 6 INTERRUPT

## 6.1 OVERVIEW

This MCU provides three interrupt sources, including two internal interrupt (T0/ADC) and one external interrupt (INT0). The external interrupt can wakeup the chip while the system is switched from power down mode to high-speed normal mode, and interrupt request is latched until return to normal mode. Once interrupt service is executed, the GIE bit in STKP register will clear to "0" for stopping other interrupt request. On the contrast, when interrupt service exits, the GIE bit will set to "1" to accept the next interrupts' request. All of the interrupt request signals are stored in INTRQ register.

\* Note: The GIE bit must enable during all interrupt operation.

## 6.2 INTEN INTERRUPT ENABLE REGISTER

INTEN is the interrupt request control register including four internal interrupts, two external interrupts enable control bits. One of the register to be set “1” is to enable the interrupt request function. Once of the interrupt occur, the stack is incremented and program jump to ORG 8 to execute interrupt service routines. The program exits the interrupt service routine when the returning interrupt service routine instruction (RETI) is executed.

| 0C9H        | Bit 7  | Bit 6 | Bit 5  | Bit 4 | Bit 3  | Bit 2 | Bit 1  | Bit 0  |
|-------------|--------|-------|--------|-------|--------|-------|--------|--------|
| INTEN       | ADCIEN | T1IEN | TC0IEN | T0IEN | CM0IEN | -     | P01IEN | P00IEN |
| Read/Write  | R/W    | R/W   | R/W    | R/W   | R/W    | -     | R/W    | R/W    |
| After reset | 0      | 0     | 0      | 0     | 0      | -     | 0      | 0      |

Bit 0      **P00IEN:** External P0.0 interrupt (INT0) control bit.

0 = Disable INT0 interrupt function.

1 = Enable INT0 interrupt function.

Bit 1      **P01IEN:** External P0.1 interrupt (INT1) control bit.

0 = Disable INT1 interrupt function.

1 = Enable INT1 interrupt function.

Bit 3      **CM0IEN:** CM0 interrupt control bit. (**Always set CM0IEN = 0**)

0 = Disable.

1 = Enable.

Bit 4      **T0IEN:** T0 timer interrupt control bit.

0 = Disable T0 interrupt function.

1 = Enable T0 interrupt function.

Bit 5      **TC0IEN:** TC0 timer interrupt control bit.

0 = Disable TC0 interrupt function.

1 = Enable TC0 interrupt function.

Bit 6      **T1IEN:** T1 timer interrupt control bit.

0 = Disable T1 interrupt function.

1 = Enable T1 interrupt function.

Bit 7      **ADCIEN:** ADC interrupt control bit.

0 = Disable ADC interrupt function.

1 = Enable ADC interrupt function.

## 6.3 INTRQ INTERRUPT REQUEST REGISTER

INTRQ is the interrupt request flag register. The register includes all interrupt request indication flags. Each one of the interrupt requests occurs, the bit of the INTRQ register would be set “1”. The INTRQ value needs to be clear by programming after detecting the flag. In the interrupt vector of program, users know the any interrupt requests occurring by the register and do the routine corresponding of the interrupt request.

| 0C8H        | Bit 7  | Bit 6 | Bit 5  | Bit 4 | Bit 3  | Bit 2 | Bit 1  | Bit 0  |
|-------------|--------|-------|--------|-------|--------|-------|--------|--------|
| INTRQ       | ADCIRQ | T1IRQ | TC0IRQ | T0IRQ | CM0IRQ | -     | P01IRQ | P00IRQ |
| Read/Write  | R/W    | R/W   | R/W    | R/W   | R/W    | -     | R/W    | R/W    |
| After reset | 0      | 0     | 0      | 0     | 0      | -     | 0      | 0      |

Bit 0      **P00IRQ:** External P0.0 interrupt (INT0) request flag.

0 = No INT0 interrupt request.

1 = INT0 interrupt request.

- 
- |       |  |

-

## 6.4 GIE GLOBAL INTERRUPT OPERATION

GIE is the global interrupt control bit. All interrupts start work after the GIE = 1. It is necessary for interrupt service request. One of the interrupt requests occurs, and the program counter (PC) points to the interrupt vector (ORG 8) and the stack add 1 level.

| 0DFH        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2  | Bit 1  | Bit 0  |
|-------------|-------|-------|-------|-------|-------|--------|--------|--------|
| <b>STKP</b> | GIE   | -     | -     | -     | -     | STKPB2 | STKPB1 | STKPB0 |
| Read/Write  | R/W   | -     | -     | -     | -     | R/W    | R/W    | R/W    |
| After reset | 0     | -     | -     | -     | -     | 1      | 1      | 1      |

Bit 7      **GIE:** Global interrupt control bit.

0 = Disable global interrupt.

1 = Enable global interrupt.

- **Example: Set global interrupt control bit (GIE).**

B0BSET      FGIE      ; Enable GIE

\*    **Note:** The GIE bit must enable during all interrupt operation.

## 6.5 INTO (P0.0) & INT1 (P0.1) INTERRUPT OPERATION

When the INTO/INT1 trigger occurs, the P00IRQ/P01IRQ will be set to “1” no matter the P00IEN/P01IEN is enable or disable. If the P00IEN/P01IEN = 1 and the trigger event P00IRQ/P01IRQ is also set to be “1”. As the result, the system will execute the interrupt vector (ORG 8). If the P00IEN = 0 and the trigger event P00IRQ/P01IRQ is still set to be “1”. Moreover, the system won’t execute interrupt vector even when the P00IRQ//P01IRQ is set to be “1”. Users need to be cautious with the operation under multi-interrupt situation.

If the interrupt trigger direction is identical with wake-up trigger direction, the INTO/INT1 interrupt request flag(INT0IRQ/INT1IRQ) is latched while system wake-up from power down mode or green mode by P0.0 wake-up trigger. System inserts to interrupt vector (ORG 8) after wake-up immediately.

- \* **Note:** INTO interrupt request can be latched by P0.0 wake-up register.
- \* **Note:** INT1 interrupt request can be latched by P0.1 wake-up register.

\* **Note:** The interrupt trigger direction of P0.0/P0.1 is control by PEDGE register.

| 0BFH         | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|--------------|-------|-------|-------|-------|-------|-------|-------|-------|
| <b>PEDGE</b> | -     | -     | -     | -     | P01G1 | P01G0 | P00G1 | P00G0 |
|              | -     | -     | -     | -     | R/W   | R/W   | R/W   | R/W   |
| After Reset  |       |       |       |       | 1     | 0     | 1     | 0     |

Bit[0:1] **P00G[1:0]:** Port 0.0 edge select bits.

00 = reserved,  
01 = rising edge,  
10 = falling edge,  
11 = rising/falling bi-direction.

Bit[2:3] **P01G[1:0]:** Port 0.1 edge select bits.

00 = reserved,  
01 = rising edge,  
10 = falling edge,  
11 = rising/falling bi-direction.

**Example: Setup INTO interrupt request and bi-direction edge trigger.**

```

MOV      A, #98H
B0MOV    PEDGE, A      ; Set INTO interrupt trigger as bi-direction edge.

B0BSET   FP00IEN       ; Enable INTO interrupt service
B0BCLR   FP00IRQ       ; Clear INTO interrupt request flag
B0BSET   FGIE          ; Enable GIE

```

**Example: INT0 interrupt service routine.**

```

ORG      8              ; Interrupt vector
JMP      INT_SERVICE
INT_SERVICE:
...
; Push routine to save ACC and PFLAG to buffers.

B0BTS1   FP00IRQ       ; Check P00IRQ
JMP      EXIT_INT      ; P00IRQ = 0, exit interrupt vector

B0BCLR   FP00IRQ       ; Reset P00IRQ
...
; INT0 interrupt service routine

EXIT_INT:
...
RETI
; Pop routine to load ACC and PFLAG from buffers.
; Exit interrupt vector

```

## 6.6 MULTI-INTERRUPT OPERATION

Under certain condition, the software designer uses more than one interrupt requests. Processing multi-interrupt request requires setting the priority of the interrupt requests. The IRQ flags of interrupts are controlled by the interrupt event. Nevertheless, the IRQ flag "1" doesn't mean the system will execute the interrupt vector. In addition, which means the IRQ flags can be set "1" by the events without enable the interrupt. Once the event occurs, the IRQ will be logic "1". The IRQ and its trigger event relationship is as the below table.

| <b>Interrupt Name</b> | <b>Trigger Event Description</b> |
|-----------------------|----------------------------------|
| P00IRQ                | P0.0 trigger controlled by PEDGE |
| P01IRQ                | P0.1 trigger controlled by PEDGE |
| T0IRQ                 | T0C overflow                     |
| T1IRQ                 | T1C overflow                     |
| TC0IRQ                | TC0C overflow                    |
| ADCIRQ                | ADC converting end.              |

For multi-interrupt conditions, two things need to be taking care of. One is to set the priority for these interrupt requests. Two is using IEN and IRQ flags to decide which interrupt to be executed. Users have to check interrupt control bit and interrupt request flag in interrupt routine.

➤ **Example: Check the interrupt request under multi-interrupt operation**

|              |             |   |
|--------------|-------------|---|
| ORG          | 8           | ; Interrupt vector                                |
| JMP          | INT_SERVICE |   |
| INT_SERVICE: | ...         | ; Push routine to save ACC and PFLAG to buffers.  |
| INTP00CHK:   | B0BTS1      | FP00IEN ; Check INT0 interrupt request            |
|              | JMP         | INTT0CHK ; Check P00IEN                           |
|              | B0BTS0      | FP00IRQ ; Jump check to next interrupt            |
|              | JMP         | INTP00 ; Check P00IRQ                             |
| INTP01CHK:   | B0BTS1      | FP01IEN ; Check INT1 interrupt request            |
|              | JMP         | INTT0CHK ; Check P01IEN                           |
|              | B0BTS0      | FP01IRQ ; Jump check to next interrupt            |
|              | JMP         | INTP01 ; Check P01IRQ                             |
| INTT0CHK:    | B0BTS1      | FT0IEN ; Check T0 interrupt request               |
|              | JMP         | INTTC0CHK ; Check T0IEN                           |

| After reset | -     | -     | -     | 0     | 0     | 0     | 0     | 0     |

Bit[7:0] **PnM[7:0]**: Pn mode control bits. (n = 0~5).

- 0 = Pn is input mode.
- 1 = Pn is output mode.

\* **Note:**

1. *Users can program them by bit control instructions (B0BSET, B0BCLR).*
2. *Port 0 and Port 1 are bi-direction I/O port..*

➤ Example: I/O mode selecting

```
CLR      P0M          ; Set all ports to be input mode.  
CLR      P1M
```

```
MOV      A, #0FFH      ; Set all ports to be output mode.  
B0MOV   P0M,A  
B0MOV   P2M, A
```

```
B0BCLR  P0M.0         ; Set P0.0 to be input mode.
```

```
B0BSET  P0M.0         ; Set P0.0 to be output mode.
```

\

## 7.2 I/O PULL UP REGISTER

| 0E1H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |

| After Reset | -     | -     | -     | 0     | 0     | 0     | 0     | 0     |

Bit [7:0] **Pn0R~Pn7R**: I/O port pull-up resistor control bit.

0 = Disable pull-up resistor.

1 = Enable pull-up resistor.

\* Note: Note: **PnUR** is Write Only Register.

### ➤ Example: I/O Pull up Register

```
MOV      A, #0FFH ; Enable Port0 Pull-up register,
B0MOV    P0UR,A
```

## 7.3 I/O PORT DATA REGISTER

| 0D0H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| P0          | P07   | P06   | P05   | P04   | P03   | P02   | P01   | P00   |
| Read/Write  | R/W   |
| After Reset | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

| 0D1H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| P2          | -     | -     | -     | -     | -     | -     | P21   | P20   |
| Read/Write  | -     | -     | -     | -     | -     | -     | R/W   | R/W   |
| After Reset | -     | -     | -     | -     | -     | -     | 0     | 0     |

| 0D1H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| P5          | -     | -     | -     | P54   | P53   | P52   | P51   | P50   |
| Read/Write  | -     | -     | -     | R/W   | R/W   | R/W   | R/W   | R/W   |
| After Reset | -     | -     | -     | 0     | 0     | 0     | 0     | 0     |

Bit [7:0] **Pn0~Pn7**: I/O port data buffer.

0 = Input low or output low.

1 = Input high or output high.

➤ **Example: Read data from input port.**

```
B0MOV      A, P0          ; Read data from Port 0
B0MOV      A, P2          ; Read data from Port 2
```

➤ **Example: Write data to output port.**

```
MOV      A, #0FFH        ; Write data FFH to all Port.
B0MOV    P0, A
B0MOV    P2, A
```

➤ **Example: Write one bit data to output port.**

```
B0BSET   P0.0           ; Set P0.0 to be "1".
B0BCLR   P0.0           ; Set P0.0 to be "0".
```

# 8 TIMERS

## 8.1 WATCHDOG TIMER

The watchdog timer (WDT) is a binary up counter designed for monitoring program execution. If the program goes into the unknown status by noise interference, WDT overflow signal raises and resets MCU. Watchdog clock controlled by code option and the clock source is internal low-speed oscillator (32 KHz @3V).

*Watchdog overflow time = 16384 / Internal Low-Speed oscillator (sec).*

| VDD  | Internal Low RC Freq. | Watchdog Overflow Time |
|------|-----------------------|------------------------|
| 3.3V | 32KHz                 | 512ms                  |

\* Note:

1. If watchdog is “Always\_On” mode, it keeps running event under power down mode or green mode.
2. For S8KD ICE simulation, clear watchdog timer using “@RST\_WDT” macro is necessary. Or the S8KD watchdog would be error.

Watchdog clear is controlled by WDTR register. Moving **0x5A** data into WDTR is to reset watchdog timer.

| OCCH        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| <b>WDTR</b> | WDTR7 | WDTR6 | WDTR5 | WDTR4 | WDTR3 | WDTR2 | WDTR1 | WDTR0 |
| Read/Write  | W     | W     | W     | W     | W     | W     | W     | W     |
| After reset | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

➤ Example: An operation of watchdog timer is as following. To clear the watchdog timer counter in the top of the main routine of the program.

Main:

```

MOV      A, #5AH      ; Clear the watchdog timer.
B0MOV    WDTR, A
...
...
CALL    SUB1
CALL    SUB2
...
...
JMP     MAIN

```

➤ Example: Clear watchdog timer by @RST\_WDT macro.

Main:

```
@RST_WDT          ; Clear the watchdog timer.  
...  
...  
CALL      SUB1  
CALL      SUB2  
...  
...  
JMP       MAIN
```

Watchdog timer application note is as following.

- Before clearing watchdog timer, check I/O status and check RAM contents can improve system error.
- Don't clear watchdog timer in interrupt vector and interrupt service routine. That can improve main routine fail.
- Clearing watchdog timer program is only at one part of the program. This way is the best structure to enhance the watchdog timer function.

**Example: An operation of watchdog timer is as following. To clear the watchdog timer counter in the top of the main routine of the program.**

Main:

```
...  
...  
Err:    JMP $          ; Check I/O.  
        ; Check RAM  
        ; I/O or RAM error. Program jump here and don't  
        ; clear watchdog. Wait watchdog timer overflow to reset IC.
```

Correct:

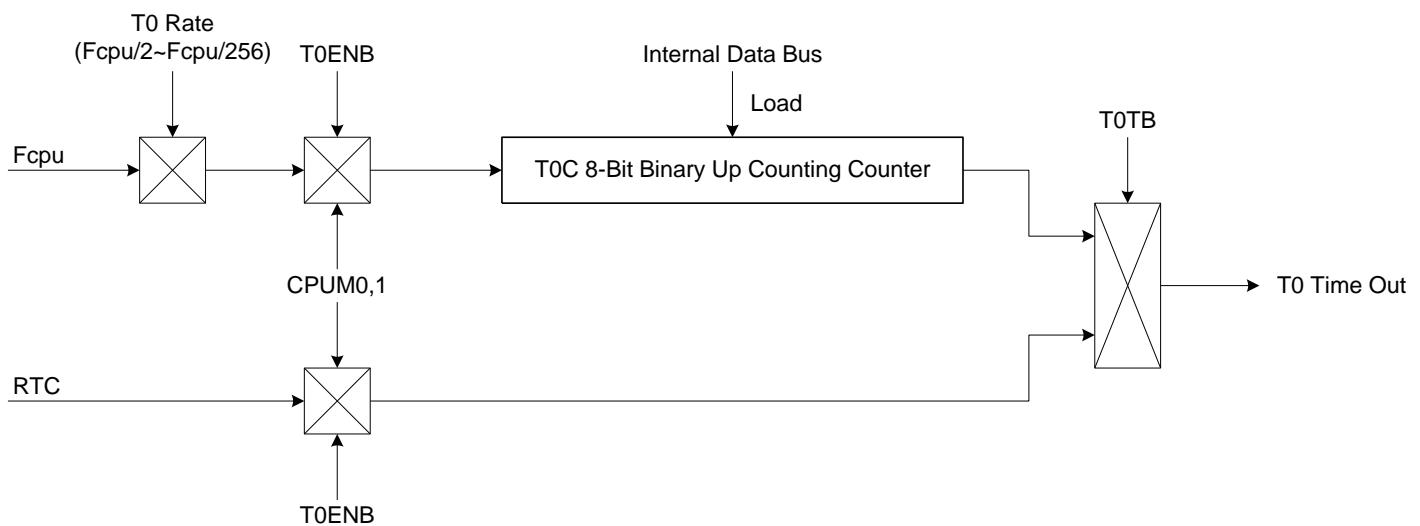

```
B0BSET    FWDRST      ; I/O and RAM are correct. Clear watchdog timer and  
                      ; execute program.  
                      ; Only one clearing watchdog timer of whole program.  
...  
CALL      SUB1  
CALL      SUB2  
...  
...  
...  
JMP       MAIN
```

## 8.2 TIMER 0 (T0)

### 8.2.1 OVERVIEW

The T0 is an 8-bit binary up timer and event counter. If T0 timer occurs an overflow (from FFH to 00H), it will continue counting and issue a time-out signal to trigger T0 interrupt to request interrupt service. The main purposes of the T0 timer are as following.

- ☞ **8-bit programmable up counting timer:** Generates interrupts at specific time intervals based on the selected clock frequency.
- ☞ **RTC timer:** Generates interrupts at real time intervals based on the selected clock source. **RTC function is only available in code option = "IHRC\_RTC".**
- ☞ **Green mode wakeup function:** T0 can be green mode wake-up time as T0ENB = 1. System will be wake-up by T0 time out.

➤ Note: In RTC mode, the T0 interval time is fixed at 0.5 sec and isn't controlled by T0C.

### 8.2.2 T0M MODE REGISTER

| 0D8H        | Bit 7 | Bit 6   | Bit 5   | Bit 4   | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|---------|---------|---------|-------|-------|-------|-------|
| <b>T0M</b>  | T0ENB | T0rate2 | T0rate1 | T0rate0 | T1X8  | TC0X8 | TC0GN | T0TB  |
| Read/Write  | R/W   | R/W     | R/W     | R/W     | R/W   | R/W   | R/W   | R/W   |
| After reset | 0     | 0       | 0       | 0       | 0     | 0     | 0     | 0     |

- Bit 0      **T0TB:** RTC clock source control bit.  
           0 = Disable RTC (T0 clock source from Fcpu).  
           1 = Enable RTC.
- Bit 1      **TC0GN:** Enable TC0 Green mode wake up function  
           0 = Disable.  
           1 = Enable.
- Bit 2      **TC0X8:** TC0 internal clock source control bit.  
           0 = TC0 internal clock source is Fcpu. TC0RATE is from Fcpu/2~Fcpu/256.  
           1 = TC0 internal clock source is Fosc. TC0RATE is from Fosc/1~Fosc/128.
- Bit 3      **T1X8:** T1 internal clock source control bit. (Recommend for touch function)  
           0 = T1 internal clock source is Fcpu. T1RATE is from Fcpu/2~Fcpu/256.  
           1 = T1 internal clock source is Fosc. T1RATE is from Fosc/1~Fosc/128.
- Bit [6:4]    **T0RATE[2:0]:** T0 internal clock select bits.  
           000 = fcpu/256.  
           001 = fcpu/128.  
           ...  
           110 = fcpu/4.  
           111 = fcpu/2.
- Bit 7      **T0ENB:** T0 counter control bit.  
           0 = Disable T0 timer.  
           1 = Enable T0 timer.

➤ **Note:** *T0RATE is not available in RTC mode. The T0 interval time is fixed at 0.5 sec.*

### 8.2.3 T0C COUNTING REGISTER

T0C is an 8-bit counter register for T0 interval time control.

| 0D9H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| <b>T0C</b>  | T0C7  | T0C6  | T0C5  | T0C4  | T0C3  | T0C2  | T0C1  | T0C0  |
| Read/Write  | R/W   |
| After reset | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

The equation of T0C initial value is as following.

$$\boxed{T0C \text{ initial value} = 256 - (T0 \text{ interrupt interval time} * \text{input clock})}$$

- Example: To set 10ms interval time for T0 interrupt. High clock is external 4MHz. Fcpu=Fosc/4. Select T0RATE=010 (Fcpu/64).

$$\begin{aligned}
 T0C \text{ initial value} &= 256 - (T0 \text{ interrupt interval time} * \text{input clock}) \\
 &= 256 - (10\text{ms} * 4\text{MHz} / 4 / 64) \\
 &= 256 - (10^2 * 4 * 10^6 / 4 / 64) \\
 &= 100 \\
 &= 64H
 \end{aligned}$$

**The basic timer table interval time of T0.**

| T0RATE | T0CLOCK  | High speed mode (Fcpu = 4MHz / 4) |                    | Low speed mode (Fcpu = 32768Hz / 4) |                    |
|--------|----------|-----------------------------------|--------------------|-------------------------------------|--------------------|
|        |          | Max overflow interval             | One step = max/256 | Max overflow interval               | One step = max/256 |
| 000    | Fcpu/256 | 65.536 ms                         | 256 us             | 8000 ms                             | 31250 us           |
| 001    | Fcpu/128 | 32.768 ms                         | 128 us             | 4000 ms                             | 15625 us           |
| 010    | Fcpu/64  | 16.384 ms                         | 64 us              | 2000 ms                             | 7812.5 us          |
| 011    | Fcpu/32  | 8.192 ms                          | 32 us              | 1000 ms                             | 3906.25 us         |
| 100    | Fcpu/16  | 4.096 ms                          | 16 us              | 500 ms                              | 1953.125 us        |
| 101    | Fcpu/8   | 2.048 ms                          | 8 us               | 250 ms                              | 976.563 us         |
| 110    | Fcpu/4   | 1.024 ms                          | 4 us               | 125 ms                              | 488.281 us         |
| 111    | Fcpu/2   | 0.512 ms                          | 2 us               | 62.5 ms                             | 244.141 us         |

## 8.2.4 T0 TIMER OPERATION SEQUENCE (High\_Clk = IHRC)

T0 timer operation sequence of setup T0 timer is as following.

- ☞ **Stop T0 timer counting, disable T0 interrupt function and clear T0 interrupt request flag.**

|        |        |   |
|--------|--------|---|
| B0BCLR | FT0ENB | ; T0 timer.                             |
| B0BCLR | FT0IEN | ; T0 interrupt function is disabled.    |
| B0BCLR | FT0IRQ | ; T0 interrupt request flag is cleared. |

- ☞ **Set T0 timer rate.**

|       |               |   |
|-------|---------------|---|
| MOV   | A, #0xxx0000b | ;The T0 rate control bits exist in bit4~bit6 of T0M. The value is from x000xxxxb~x111xxxxb. |
| B0MOV | T0M,A         | ; T0 timer is disabled.   |

- ☞ **Set T0 clock source from Fcpu or RTC.**

or

|        |       |                                |
|--------|-------|--------------------------------|
| B0BCLR | FT0TB | ; Select T0 Fcpu clock source. |
| B0BSET | FT0TB | ; Select T0 RTC clock source.  |

- ☞ **Set T0 interrupt interval time.**

|       |        |                  |
|-------|--------|------------------|
| MOV   | A,#7FH |                  |
| B0MOV | T0C,A  | ; Set T0C value. |

- ☞ **Set T0 timer function mode.**

|        |        |                                 |
|--------|--------|---------------------------------|
| B0BSET | FT0IEN | ; Enable T0 interrupt function. |
|--------|--------|---------------------------------|

- ☞ **Enable T0 timer.**

|        |        |                    |
|--------|--------|--------------------|
| B0BSET | FT0ENB | ; Enable T0 timer. |
|--------|--------|--------------------|

## 8.2.5 RTC OPERATION SEQUENCE (High\_Clk =“IHRC\_RTC” and “T0TB = 1”)

T0 timer with RTC operation sequence (**High\_Clk code option = “IHRC\_RTC” and “T0TB = 1”**) of setup T0 timer is as following.

- **Declare buffer.**

```
.DATA
    OLDT0C      DS          1
    NEWT0C      DS          1
    T0FLAG      DS          1
    T0IRQFLAG   EQU        T0FLAG.0
```

- **Stop T0 timer counting, disable T0 interrupt function and clear T0 interrupt request flag.**

```
B0BCLR      FT0ENB      ; T0 timer.
B0BCLR      FT0IEN      ; T0 interrupt function is disabled.
B0BCLR      FT0IRQ      ; T0 interrupt request flag is cleared.
```

- **Set T0M register.**

```
MOV         A, #00000000b
B0MOV      T0M,A
```

- **Set T0 clock source from RTC.**

```
B0BSET      FT0TB      ; Select T0 RTC clock source.
```

- **Set T0 interrupt interval time.**

```
CLR         T0C         ; Clear T0C value.
CLR         OLDT0C     ; Clear OLDT0C value.
CLR         NEWT0C     ; Clear NEWT0C value.
CLR         T0FLAG     ; Clear T0FLAG before execute Main routing.
```

- **Disable T0 timer function mode.**

```
B0BCLR      FT0IEN      ; Disable T0 interrupt function.
```

- **Enable T0 timer with RTC function.**

```
B0BSET      FT0ENB      ; Enable T0 timer.
```

- **Execute MAIN routing polling T0 timer.(Execute MAIN routing interval time is not more than 200ms).**

```
MAIN:
    B0BCLR      FT0IRQ      ; Clear FT0IRQ.
    CALL        CKT_T0CVAL   ; Check T0C value overflow
    CALL        CKT_T0FLAG   ; Check T0C overflow Flag and update time.
    .
    .
    JMP         MAIN        ; Jmp MAIN.
```

- **CKT\_T0CVAL sub-routing (Check T0C value status).**

**CKT\_T0CVAL:**

```
MOV         A, T0C      ; Read T0C value
MOV         NEWT0C, A   ; Save to NEWT0C
SUB         A, OLDT0C   ; A sub OLDT0C value.
```

|                 |   |                              |   |
|-----------------|---|------------------------------|---|
|                 | B0BTS0<br>JMP   | FC<br>EXIT_CKTT0CVAL:        | ; If FC = 0, borrow<br>; If FC = 1, jmp EXIT_CKTT0CVAL  |
| EXIT_CKTT0CVAL: | B0BSET  | T0IRQFLAG                    | ; Set T0IRQFLAG (T0C counts overflow.).   |
|                 | MOV<br>MOV<br>RET   | A, NEWT0C<br>OLDT0C, A       | ; Update T0C value<br>; Exit sub-routing.   |
| ➤               | <b>CKT_T0FLAG sub-routing (Check T0 timer overflow flag).</b> |                              |   |
| CKT_T0FLAG:     | B0BTS1<br>JMP   | T0IRQFLAG<br>EXIT_CKTT0FLAG  | ; Check T0IRQ status.<br>; Jmp EXIT_CKTT0FLAG.  |
|                 | B0BCLR<br>CALL<br>B0BCLR                                      | T0IRQFLAG<br>DELAY<br>FT0IRQ | ; Clear T0IRQFLAG.<br>; Call delay time = over 1/32.768ms (for RTC limit).<br>; Clear FT0IRQ. |

## 8.3 TIMER/COUNTER 0 (TC0)

### 8.3.1 OVERVIEW

The TC0 is an 8-bit binary up counting timer. TC0 has two clock sources including internal clock and external clock for counting a precision time. The internal clock source is from Fcpu or Fosc controlled by TC0X8 flag to get faster clock source (Fosc). The external clock is INT0 from P0.0 pin (Falling edge trigger). Using TC0M register selects TC0C's clock source from internal or external. If TC0 timer occurs an overflow, it will continue counting and issue a time-out signal to trigger TC0 interrupt to request interrupt service. TC0 overflow time is 0xFF to 0X00 normally. Under PWM mode, TC0 overflow is decided by PWM cycle controlled by ALOAD0 and TC0OUT bits.

The main purposes of the TC0 timer are as following.

- ☞ **8-bit programmable up counting timer:** Generates interrupts at specific time intervals based on the selected clock frequency.
- ☞ **External event counter:** Counts system “events” based on falling edge detection of external clock signals at the INT0 input pin.
- ☞ **Green mode wake-up function:** TC0 can be green mode wake-up timer. System will be wake-up by TC0 time out.
- ☞ **Buzzer output**
- ☞ **PWM output**

### 8.3.2 TC0M MODE REGISTER

| ODAH        | Bit 7  | Bit 6    | Bit 5    | Bit 4    | Bit 3  | Bit 2  | Bit 1  | Bit 0   |
|-------------|--------|----------|----------|----------|--------|--------|--------|---------|
| TC0M        | TC0ENB | TC0rate2 | TC0rate1 | TC0rate0 | TC0CKS | ALOAD0 | TC0OUT | PWM0OUT |
| Read/Write  | R/W    | R/W      | R/W      | R/W      | R/W    | R/W    | R/W    | R/W     |
| After reset | 0      | 0        | 0        | 0        | 0      | 0      | 0      | 0       |

- Bit 0      **PWM0OUT:** PWM output control bit.  
           0 = Disable PWM output.  
           1 = Enable PWM output. PWM duty controlled by TC0OUT, ALOAD0 bits.
- Bit 1      **TC0OUT:** TC0 time out toggle signal output control bit. **Only valid when PWM0OUT = 0.**  
           0 = Disable, P5.4 is I/O function.  
           1 = Enable, P5.4 is output TC0OUT signal.
- Bit 2      **ALOAD0:** Auto-reload control bit. **Only valid when PWM0OUT = 0.**  
           0 = Disable TC0 auto-reload function.  
           1 = Enable TC0 auto-reload function.
- Bit 3      **TC0CKS:** TC0 clock source select bit.  
           0 = Internal clock (Fcpu or Fosc).  
           1 = External clock from P0.0/INT0 pin.
- Bit [6:4]    **TC0RATE[2:0]:** TC0 internal clock select bits.

| TC0RATE [2:0] | TC0X8 = 0  | TC0X8 = 1  |
|---------------|------------|------------|
| 000           | Fcpu / 256 | Fosc / 128 |
| 001           | Fcpu / 128 | Fosc / 64  |
| 010           | Fcpu / 64  | Fosc / 32  |
| 011           | Fcpu / 32  | Fosc / 16  |
| 100           | Fcpu / 16  | Fosc / 8   |
| 101           | Fcpu / 8   | Fosc / 4   |
| 110           | Fcpu / 4   | Fosc / 2   |
| 111           | Fcpu / 2   | Fosc / 1   |

- Bit 7      **TC0ENB:** TC0 counter control bit.  
           0 = Disable TC0 timer.  
           1 = Enable TC0 timer.

\* Note: When TC0CKS=1, TC0 became an external event counter and TC0RATE is useless. No more P0.0 interrupt request will be raised. (P0.0IRQ will be always 0).

### 8.3.3 T1X8, TC0X8, TC0GN FLAGS

| 0D8H        | Bit 7 | Bit 6   | Bit 5   | Bit 4   | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|---------|---------|---------|-------|-------|-------|-------|
| <b>T0M</b>  | T0ENB | T0rate2 | T0rate1 | T0rate0 | T1X8  | TC0X8 | TC0GN | T0TB  |
| Read/Write  | R/W   | R/W     | R/W     | R/W     | R/W   | R/W   | R/W   | R/W   |
| After reset | 0     | 0       | 0       | 0       | 0     | 0     | 0     | 0     |

- Bit 0      **T0TB:** RTC clock source control bit.  
           0 = Disable RTC (T0 clock source from Fcpu).  
           1 = Enable RTC.
- Bit 1      **TC0GN:** Enable TC0 Green mode wake up function  
           0 = Disable.  
           1 = Enable.
- Bit 2      **TC0X8:** TC0 internal clock source control bit.  
           0 = TC0 internal clock source is Fcpu. TC0RATE is from Fcpu/2~Fcpu/256.  
           1 = TC0 internal clock source is Fhosc. TC0RATE is from Fhosc/1~Fhosc/128.
- Bit 3      **T1X8:** T1 internal clock source control bit. (Recommend for touch function)  
           0 = T1 internal clock source is Fcpu. T1RATE is from Fcpu/2~Fcpu/256.  
           1 = T1 internal clock source is Fhosc. T1RATE is from Fhosc/1~Fhosc/128.
- Bit [6:4]    **T0RATE[2:0]:** T0 internal clock select bits.  
           000 = fcpu/256.  
           001 = fcpu/128.  
           ...  
           110 = fcpu/4.  
           111 = fcpu/2.
- Bit 7      **T0ENB:** T0 counter control bit.  
           0 = Disable T0 timer.  
           1 = Enable T0 timer.

\*      Note: Under TC0 event counter mode (TC0CKS=1), TC0X8 bit and TC0RATE are useless.

### 8.3.4 TC0C COUNTING REGISTER

TC0C is an 8-bit counter register for TC0 interval time control.

| 0DBH        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| <b>TC0C</b> | TC0C7 | TC0C6 | TC0C5 | TC0C4 | TC0C3 | TC0C2 | TC0C1 | TC0C0 |
| Read/Write  | R/W   |
| After reset | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

The equation of TC0C initial value is as following.

$$\text{TC0C initial value} = 256 - (\text{TC0 interrupt interval time} * \text{input clock})$$

| TC0X8                    | TC0C valid value | TC0C value binary type | Remark                 |
|--------------------------|------------------|------------------------|------------------------|
| 0<br>(Fcpu/2~Fcpu/256)   | 0x00~0xFF        | 00000000b~11111111b    | Overflow per 256 count |
| 1<br>(Fhosc/1~Fhosc/128) | 0x00~0xFF        | 00000000b~11111111b    | Overflow per 256 count |

- Example: To set 10ms interval time for TC0 interrupt. TC0 clock source is Fcpu (TC0KS=0, TC0X8=0) and no PWM output (PWM0=0). High clock is external 4MHz. Fcpu=Fhosc/4. Select TC0RATE=010 (Fcpu/64).

$$\begin{aligned}
\text{TC0C initial value} &= 256 - (\text{TC0 interrupt interval time} * \text{input clock}) \\
&= 256 - (10\text{ms} * 4\text{MHz} / 4 / 64) \\
&= 256 - (10^2 * 4 * 10^6 / 4 / 64) \\
&= 100 \\
&= 64H
\end{aligned}$$

The basic timer table interval time of TC0, TC0X8 = 0.

| TC0RATE | TC0CLOCK | High speed mode (Fcpu = 4MHz / 4) |                    | Low speed mode (Fcpu = 32768Hz / 4) |                    |
|---------|----------|-----------------------------------|--------------------|-------------------------------------|--------------------|
|         |          | Max overflow interval             | One step = max/256 | Max overflow interval               | One step = max/256 |
| 000     | Fcpu/256 | 65.536 ms                         | 256 us             | 8000 ms                             | 31250 us           |
| 001     | Fcpu/128 | 32.768 ms                         | 128 us             | 4000 ms                             | 15625 us           |
| 010     | Fcpu/64  | 16.384 ms                         | 64 us              | 2000 ms                             | 7812.5 us          |
| 011     | Fcpu/32  | 8.192 ms                          | 32 us              | 1000 ms                             | 3906.25 us         |
| 100     | Fcpu/16  | 4.096 ms                          | 16 us              | 500 ms                              | 1953.125 us        |
| 101     | Fcpu/8   | 2.048 ms                          | 8 us               | 250 ms                              | 976.563 us         |
| 110     | Fcpu/4   | 1.024 ms                          | 4 us               | 125 ms                              | 488.281 us         |
| 111     | Fcpu/2   | 0.512 ms                          | 2 us               | 62.5 ms                             | 244.141 us         |

The basic timer table interval time of TC0, TC0X8 = 1.

| TC0RATE | TC0CLOCK  | High speed mode (Fcpu = 4MHz / 4) |                    | Low speed mode (Fcpu = 32768Hz / 4) |                    |
|---------|-----------|-----------------------------------|--------------------|-------------------------------------|--------------------|
|         |           | Max overflow interval             | One step = max/256 | Max overflow interval               | One step = max/256 |
| 000     | Fhosc/128 | 8.192 ms                          | 32 us              | 1000 ms                             | 3906.25 us         |
| 001     | Fhosc/64  | 4.096 ms                          | 16 us              | 500 ms                              | 1953.125 us        |
| 010     | Fhosc/32  | 2.048 ms                          | 8 us               | 250 ms                              | 976.563 us         |
| 011     | Fhosc/16  | 1.024 ms                          | 4 us               | 125 ms                              | 488.281 us         |
| 100     | Fhosc/8   | 0.512 ms                          | 2 us               | 62.5 ms                             | 244.141 us         |
| 101     | Fhosc/4   | 0.256 ms                          | 1 us               | 31.25 ms                            | 122.07 us          |
| 110     | Fhosc/2   | 0.128 ms                          | 0.5 us             | 15.625 ms                           | 61.035 us          |
| 111     | Fhosc/1   | 0.064 ms                          | 0.25 us            | 7.813 ms                            | 30.517 us          |

### 8.3.5 TC0R AUTO-LOAD REGISTER

TC0 timer is with auto-load function controlled by ALOAD0 bit of TC0M. When TC0C overflow occurring, TC0R value will load to TC0C by system. It is easy to generate an accurate time, and users don't reset TC0C during interrupt service routine.

➤ \* **Note:** Under PWM mode, auto-load is enabled automatically. The ALOAD0 bit is selecting overflow boundary.

| 0CDH        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| <b>TC0R</b> | TC0R7 | TC0R6 | TC0R5 | TC0R4 | TC0R3 | TC0R2 | TC0R1 | TC0R0 |
| Read/Write  | W     | W     | W     | W     | W     | W     | W     | W     |
| After reset | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

The equation of TC0R initial value is as following.

$$\text{TC0R initial value} = 256 - (\text{TC0 interrupt interval time} * \text{input clock})$$

N is TC0 overflow boundary number. TC0 timer overflow time has six types (TC0 timer, TC0 event counter, TC0 Fcpu clock source, TC0 Fhosc clock source, PWM mode and no PWM mode). These parameters decide TC0 overflow time and valid value as follow table.

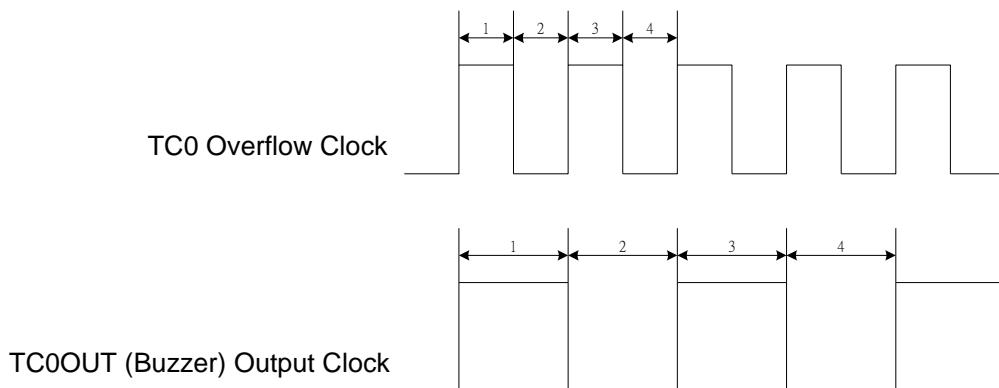

| TC0X8                    | TC0R valid value | TC0R value binary type |
|--------------------------|------------------|------------------------|
| 0<br>(Fcpu/2~Fcpu/256)   | 0x00~0xFF        | 00000000b~11111111b    |
| 1<br>(Fhosc/1~Fhosc/128) | 0x00~0xFF        | 00000000b~11111111b    |

- Example: To set 10ms interval time for TC0 interrupt. TC0 clock source is Fcpu (TC0KS=0, TC0X8=0) and no PWM output (PWM0=0). High clock is external 4MHz. Fcpu=Fhosc/4. Select TC0RATE=010 (Fcpu/64).

$$\begin{aligned}
 \text{TC0R initial value} &= 256 - (\text{TC0 interrupt interval time} * \text{input clock}) \\
 &= 256 - (10\text{ms} * 4\text{MHz} / 4 / 64) \\
 &= 256 - (10^2 * 4 * 10^6 / 4 / 64) \\
 &= 100 \\
 &= 64H
 \end{aligned}$$

### 8.3.6 TC0 CLOCK FREQUENCY OUTPUT (BUZZER)

Buzzer output (TC0OUT) is from TC0 timer/counter frequency output function. By setting the TC0 clock frequency, the clock signal is output to P5.4 and the P5.4 general purpose I/O function is auto-disable. The TC0OUT frequency is divided by 2 from TC0 interval time. TC0OUT frequency is 1/2 TC0 frequency. The TC0 clock has many combinations and easily to make difference frequency. The TC0OUT frequency waveform is as following.

- Example: Setup TC0OUT output from TC0 to TC0OUT (P5.4). The external high-speed clock is 4MHz. The TC0OUT frequency is 0.5KHz. Because the TC0OUT signal is divided by 2, set the TC0 clock to 1KHz. The TC0 clock source is from external oscillator clock. T0C rate is Fcpu/4. The TC0RATE2~TC0RATE1 = 110. TC0C = TC0R = 6.

```

MOV      A,#01100000B
B0MOV   TC0M,A          ; Set the TC0 rate to Fcpu/4

MOV      A,#6
B0MOV   TC0C,A          ; Set the auto-reload reference value
B0MOV   TC0R,A

B0BSET  FTC0OUT         ; Enable TC0 output to P5.4 and disable P5.4 I/O function
B0BSET  FALOAD1         ; Enable TC0 auto-reload function
B0BSET  FTC0ENB         ; Enable TC0 timer

```

- \*
  - Note:** Buzzer output is enable, and “PWM0OUT” must be “0”.

### 8.3.7 TC0 TIMER OPERATION SEQUENCE

TC0 timer operation includes timer interrupt, event counter, TC0OUT and PWM. The sequence of setup TC0 timer is as following.

- ☞ Stop TC0 timer counting, disable TC0 interrupt function and clear TC0 interrupt request flag.

|        |         |  |
|--------|---------|--|
| B0BCLR | FTC0ENB | ; TC0 timer, TC0OUT and PWM stop.        |
| B0BCLR | FTC0IEN | ; TC0 interrupt function is disabled.    |
| B0BCLR | FTC0IRQ | ; TC0 interrupt request flag is cleared. |

- ☞ Set TC0 timer rate. (Besides event counter mode.)

|       |               |  |
|-------|---------------|--|
| MOV   | A, #0xxx0000b | ; The TC0 rate control bits exist in bit4~bit6 of TC0M. The ; value is from x000xxxxb~x111xxxxb. |
| B0MOV | TC0M,A        | ; TC0 interrupt function is disabled.  |

- ☞ Set TC0 timer clock source.

; Select TC0 internal / external clock source.

|        |         |                                     |
|--------|---------|-------------------------------------|
| B0BCLR | FTC0CKS | ; Select TC0 internal clock source. |
|--------|---------|-------------------------------------|

or

|        |         |                                     |
|--------|---------|-------------------------------------|
| B0BSET | FTC0CKS | ; Select TC0 external clock source. |
|--------|---------|-------------------------------------|

; Select TC0 Fcpu / Fhosc internal clock source .

|        |        |  |
|--------|--------|--|
| B0BCLR | FTC0X8 | ; Select TC0 Fcpu internal clock source. |
|--------|--------|--|

or

|        |        |   |
|--------|--------|---|
| B0BSET | FTC0X8 | ; Select TC0 Fhosc internal clock source. |
|--------|--------|---|

➤ \* Note: TC0X8 is useless in TC0 external clock source mode.

- ☞ Set TC0 timer auto-load mode.

|        |         |                                    |
|--------|---------|------------------------------------|
| B0BCLR | FALOAD0 | ; Enable TC0 auto reload function. |
|--------|---------|------------------------------------|

or

|        |         |                                     |

## 8.4 TIMER/COUNTER 1 (T1)

### 8.4.1 OVERVIEW

The T1 timer includes a **16-bit binary up timer**. If 16-bit timer occurs an overflow (from 0xFFFF to 0x0000) or the 16-bit counter occurs an overflow (from 0xFFFF to 0x0000), it will issue a time-out signal to indicate T1 time out event.

The main purpose of the T1 timer is as following.

- ☞ **16-bit programmable up counting timer:** Generate time-out at specific time intervals based on the selected clock frequency.
- ☞ **Interrupt function:** T1 timer function and capture timer function support interrupt function. When T1 counting timer occurs overflow, the T1IRQ actives and the system points program counter to interrupt vector to do interrupt sequence.
- ☞ **Green mode wakeup function:** T1 can be green mode wake-up as T1ENB = 1. System will be wake-up when T1IRQ actives.

## 8.4.2 T1M MODE REGISTER

| ODCH        | Bit 7 | Bit 6   | Bit 5   | Bit 4   | Bit 3  | Bit 2    | Bit 1 | Bit 0 |
|-------------|-------|---------|---------|---------|--------|----------|-------|-------|

Bit 1      **T1OV:** T1 16-bit counter overflow indicator.  
0 = Non overflow.  
1 = T1CH, T1CL 16-bit counter overflows.

Bit 2      **CPTStart:** Reserved

Bit 3      **ALOAD1:** T1 Auto-reload control bit.  
0 = Disable T1 auto-reload function.  
1 = Enable T1 auto-reload function.

Bit [6:4]    **T1RATE[2:0]:** T1 internal clock select bits.

| T1RATE [2:0] | T1X8 = 0   | T1X8 = 1    |
|--------------|------------|-------------|
| 000          | Fcpu / 256 | Fhosc / 128 |
| 001          | Fcpu / 128 | Fhosc / 64  |
| 010          | Fcpu / 64  | Fhosc / 32  |
| 011          | Fcpu / 32  | Fhosc / 16  |
| 100          | Fcpu / 16  | Fhosc / 8   |
| 101          | Fcpu / 8   | Fhosc / 4   |
| 110          | Fcpu / 4   | Fhosc / 2   |
| 111          | Fcpu / 2   | Fhosc / 1   |

Bit 7      **T1ENB:** T1 counter control bit.  
0 = Disable T1 timer.  
1 = Enable T1 timer.

| T1ENB | CPTStart | T1 Purpose   | 16-bit timer  |
|-------|----------|--|---------------|
| 0     | x        | None   | Stop          |
| 1     | x        | T1 timer Counting  | Run           |
| 1     | 0        | T1 timer Enable  | Stop          |
| 1     | 1        | Clear T1C(H,L) and T1 start to count until T1 timer overflow | Clear and Run |

- \* Note: When T1ENB=1, CPTStart=1, Enable the T1 16-bit timer start to counting, and CPTStart = 0 means end of processing.
- \* Note: In capacitive sensing mode, T1 can't be normal timer, but used to calculate relaxation oscillator rate for capacitive sensing measurement.

### 8.4.3 T1X8, TC0X8, TC0GN FLAGS

| 0D8H        | Bit 7 | Bit 6   | Bit 5   | Bit 4   | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|---------|---------|---------|-------|-------|-------|-------|
| <b>T0M</b>  | T0ENB | T0rate2 | T0rate1 | T0rate0 | T1X8  | TC0X8 | TC0GN | T0TB  |
| Read/Write  | R/W   | R/W     | R/W     | R/W     | R/W   | R/W   | R/W   | R/W   |
| After reset | 0     | 0       | 0       | 0       | 0     | 0     | 0     | 0     |

Bit 0      **T0TB:** RTC clock source control bit.  
0 = Disable RTC (T0 clock source from Fcpu).  
1 = Enable RTC.

Bit 1      **TC0GN:** Enable TC0 Green mode wake up function  
0 = Disable.  
1 = Enable.

Bit 2      **TC0X8:** TC0 internal clock source control bit.  
0 = TC0 internal clock source is Fcpu. TC0RATE is from Fcpu/2~Fcpu/256.  
1 = TC0 internal clock source is Fhosc. TC0RATE is from Fhosc/1~Fhosc/128.

Bit 3      **T1X8:** TC1 internal clock source control bit.  
0 = T1 internal clock source is Fcpu. T1RATE is from Fcpu/2~Fcpu/256.  
1 = T1 internal clock source is Fhosc. T1RATE is from Fhosc/1~Fhosc/128.

Bit [6:4]    **T0RATE[2:0]:** T0 internal clock select bits.  
000 = fcpu/256.  
001 = fcpu/128.  
...  
110 = fcpu/4.  
111 = fcpu/2.

Bit 7      **T0ENB:** T0 counter control bit.  
0 = Disable T0 timer.  
1 = Enable T0 timer.

\*      Note: When T1ENB=1, TCHEN=0, T1 become a 16-bit timer counting. T1ENB only controls T1 16-bit timer function, and trigger when TCHEN = 0.

#### 8.4.4 T1C COUNTING REGISTER

T1C is an 16-bit counter register for T1 interval time control.

| 0B1H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| <b>T1CL</b> | T1CL7 | T1CL6 | T1CL5 | T1CL4 | T1CL3 | T1CL2 | T1CL1 | T1CL0 |
| Read/Write  | R/W   |
| After Reset | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

| 0B2H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| <b>T1CH</b> | T1CH7 | T1CH6 | T1CH5 | T1CH4 | T1CH3 | T1CH2 | T1CH1 | T1CH0 |
| Read/Write  | R/W   |
| After Reset | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

T1 counter is 16-bit type and combines T1CH and T1CL counter buffers.

\* Note: Read T1 counter buffer sequence is to read T1CL first, and then read T1CH.  
Write T1 counter buffer sequence is to write T1CH first, and then write T1CL.

The equation of T1C initial value is as following.

$$\boxed{T1C \text{ initial value} = 65536 - (T1 \text{ interrupt interval time} * \text{input clock})}$$

| T1X8                     | T1C valid value | T1C value binary type               | Remark                   |
|--------------------------|-----------------|-------------------------------------|--------------------------|
| 0<br>(Fcpu/2~Fcpu/256)   | 0x0000~0xFFFF   | 0000000000000000b~1111111111111111b | Overflow per 65536 count |
| 1<br>(Fhosc/1~Fhosc/128) | 0x0000~0xFFFF   | 0000000000000000b~1111111111111111b | Overflow per 65536 count |

- Example: To set 10ms interval time for T1 interrupt. T1 clock source is Fcpu (T1X8=0). High clock is external 4MHz. Fcpu=Fhosc/4. Select T1RATE=010 (Fcpu/64).

$$\begin{aligned}
T1C \text{ initial value} &= 65536 - (T1 \text{ interrupt interval time} * \text{input clock}) \\
&= 65536 - (10\text{ms} * 4\text{MHz} / 4 / 64) \\
&= 65536 - (10^{-2} * 4 * 10^6 / 4 / 64) \\
&= 65380 \\
&= FF64H
\end{aligned}$$

The basic timer table interval time of T1, T1X8 = 0.

| T1RATE | T1CLOCK  | High speed mode (Fcpu = 4MHz / 4) |                    | Low speed mode (Fcpu = 32768Hz / 4) |                    |
|--------|----------|-----------------------------------|--------------------|-------------------------------------|--------------------|
|        |          | Max overflow interval             | One step = max/256 | Max overflow interval               | One step = max/256 |
| 000    | Fcpu/256 | 16.777 s                          | 256 us             | 2048 s                              | 31250 us           |
| 001    | Fcpu/128 | 8.388 s                           | 128 us             | 1024 s                              | 15625 us           |
| 010    | Fcpu/64  | 4.194 s                           | 64 us              | 512 s                               | 7812.5 us          |
| 011    | Fcpu/32  | 2.097 s                           | 32 us              | 256 s                               | 3906.25 us         |
| 100    | Fcpu/16  | 1.048 s                           | 16 us              | 128 s                               | 1953.125 us        |

| 110    | Fcpu/4   | 262.144 ms                        | 4 us               | 31 s                                | 488.281 us         |
| 111    | Fcpu/2   | 131.072 ms                        | 2 us               | 16 s                                | 244.141 us         |

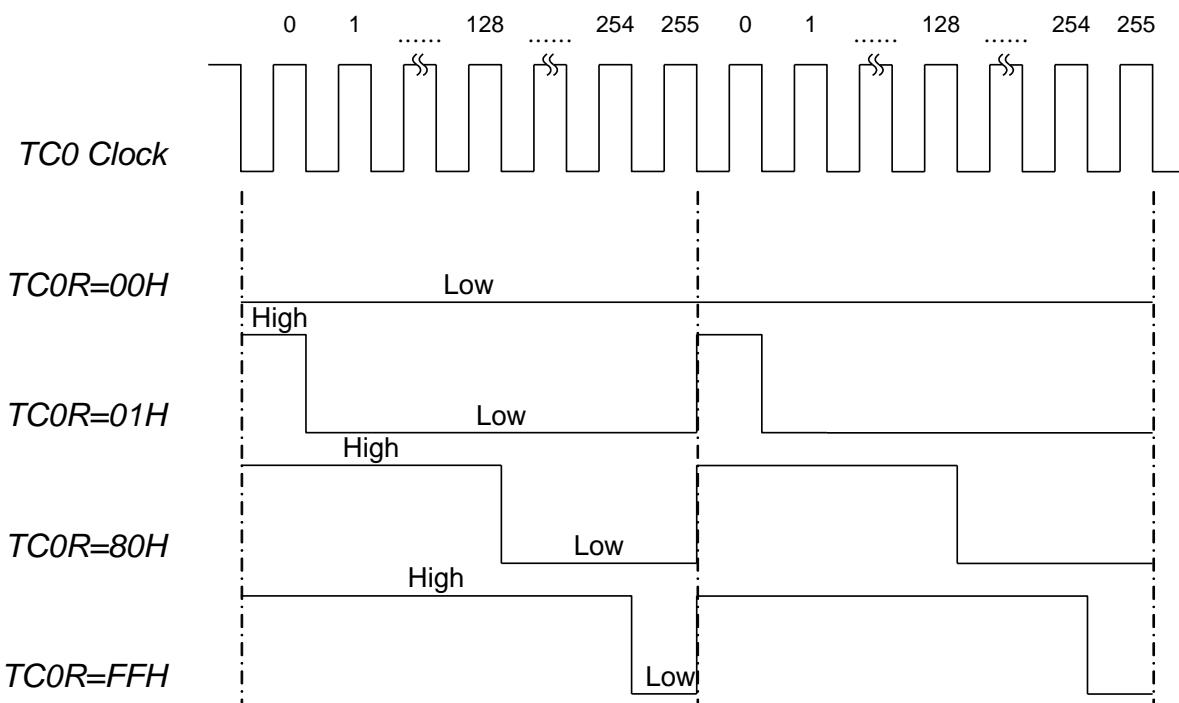

## 8.5 PWM0 MODE

### 8.5.1 OVERVIEW

PWM function is generated by TC0 timer counter and output the PWM signal to PWM0OUT pin (P5.4). The 8-bit counter counts modulus 256 bits. The value of the 8-bit counter (TC0C) is compared to the contents of the reference register (TC0R). When the reference register value (TC0R) is equal to the counter value (TC0C), the PWM output goes low. When the counter reaches zero, the PWM output is forced high. The ratio (duty) of the PWM0 output is TC0R/256.

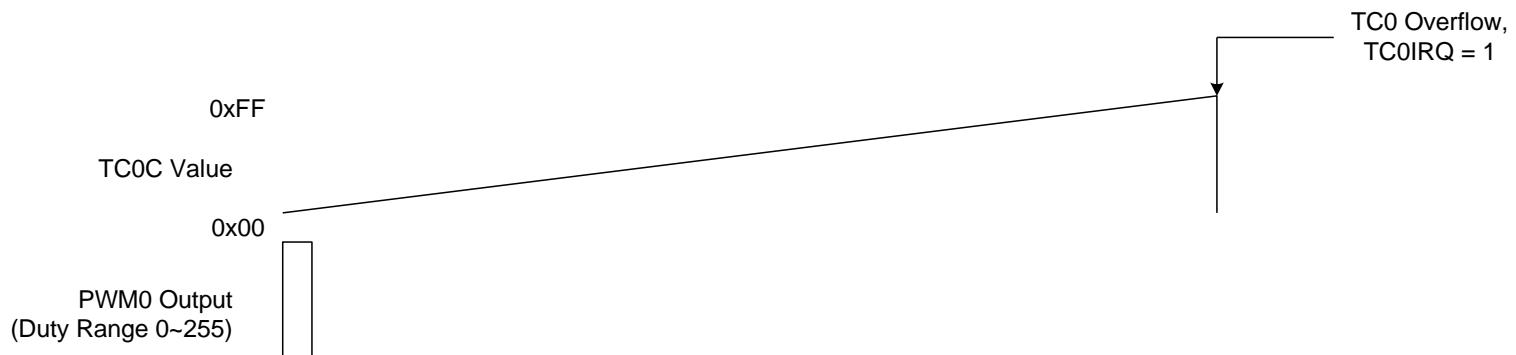

| PWM duty range | TC0C valid value | TC0R valid bits value | MAX. PWM Frequency (Fcpu = 4MHz) | Remark                 |
|----------------|------------------|-----------------------|----------------------------------|------------------------|
| 0/256~255/256  | 0x00~0xFF        | 0x00~0xFF             | 7.8125K                          | Overflow per 256 count |

**The Output duty of PWM is with different TC0R. Duty range is from 0/256~255/256.**

## 8.5.2 TC0IRQ AND PWM DUTY

In PWM mode, the frequency of TC0IRQ is depended on PWM duty range. From following diagram, the TC0IRQ frequency is related with PWM duty.

## 8.5.3 PWM PROGRAM EXAMPLE

- Example: Setup PWM0 output from TC0 to PWM0OUT (P5.4). The external high-speed oscillator clock is 4MHz. Fcpu = Fosc/4. The duty of PWM is 30/256. The PWM frequency is about 1KHz. The PWM clock source is from external oscillator clock. TC0 rate is Fcpu/4. The TC0RATE2~TC0RATE1 = 110. TC0C = TC0R = 30.

```

MOV      A,#01100000B
B0MOV   TC0M,A          ; Set the TC0 rate to Fcpu/4

MOV      A,#30
B0MOV   TC0C,A          ; Set the PWM duty to 30/256
B0MOV   TC0R,A

B0BSET  FPWM0OUT        ; Enable PWM0 output to P5.4 and disable P5.4 I/O function
B0BSET  FTC0ENB          ; Enable TC0 timer

```

➤ \* Note: The TC0R is write-only register. Don't process them using INCMS, DECMS instructions.

- Example: Modify TC0R registers' value.

```

MOV      A, #30H          ; Input a number using B0MOV instruction.
B0MOV   TC0R, A

INCMS   BUF0              ; Get the new TC0R value from the BUF0 buffer defined by
NOP                  ; programming.

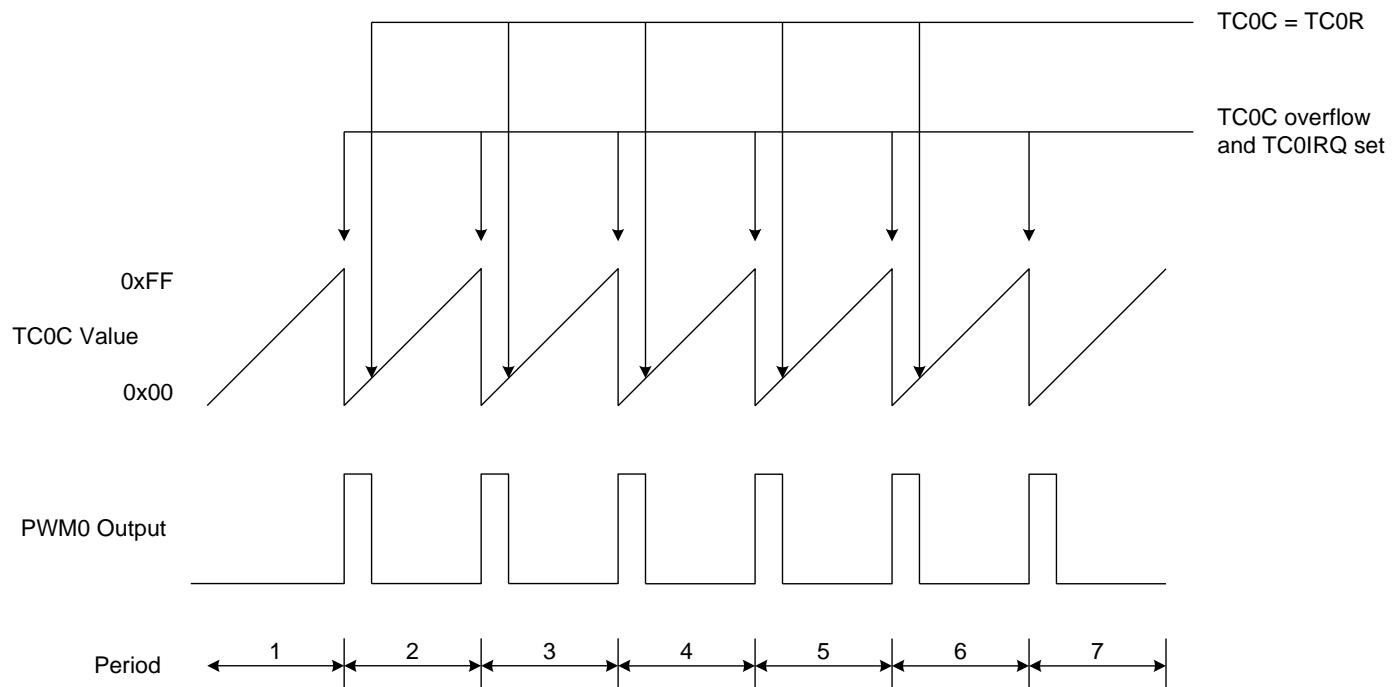

B0MOV   A, BUF0
B0MOV   TC0R, A

```

➤ \* Note: The PWM can work with interrupt request.

### 8.5.4 PWM0 DUTY CHANGING NOTICE

In PWM mode, the system will compare TC0C and TC0R all the time. When  $TC0C < TC0R$ , the PWM will output logic "High", when  $TC0C \geq TC0R$ , the PWM will output logic "Low". If TC0C is changed in certain period, the PWM duty will change immediately. If TC0R is fixed all the time, the PWM waveform is also the same.

Above diagram is shown the waveform with fixed TC0R. In every TC0C overflow PWM output "High, when  $TC0C \geq TC0R$  PWM output "Low".

\* **Note: Setting PWM duty in program processing must be at the new cycle start.**

# 9 LCD DRIVER

LCD driver includes R-type and C-type structures with 4 common pins and 20 segment pins in the SN8P2929. The LCD scan timing is 1/4 duty with 1/2 bias or 1/3 bias structure, all support in R-type and C-type mode to yield 80 dots LCD driver. LCD power and bias voltage can be adjusted by additional external bias circuit in R-type LCD driver, or adjusted by register setting internal charge pump in C-type LCD driver.

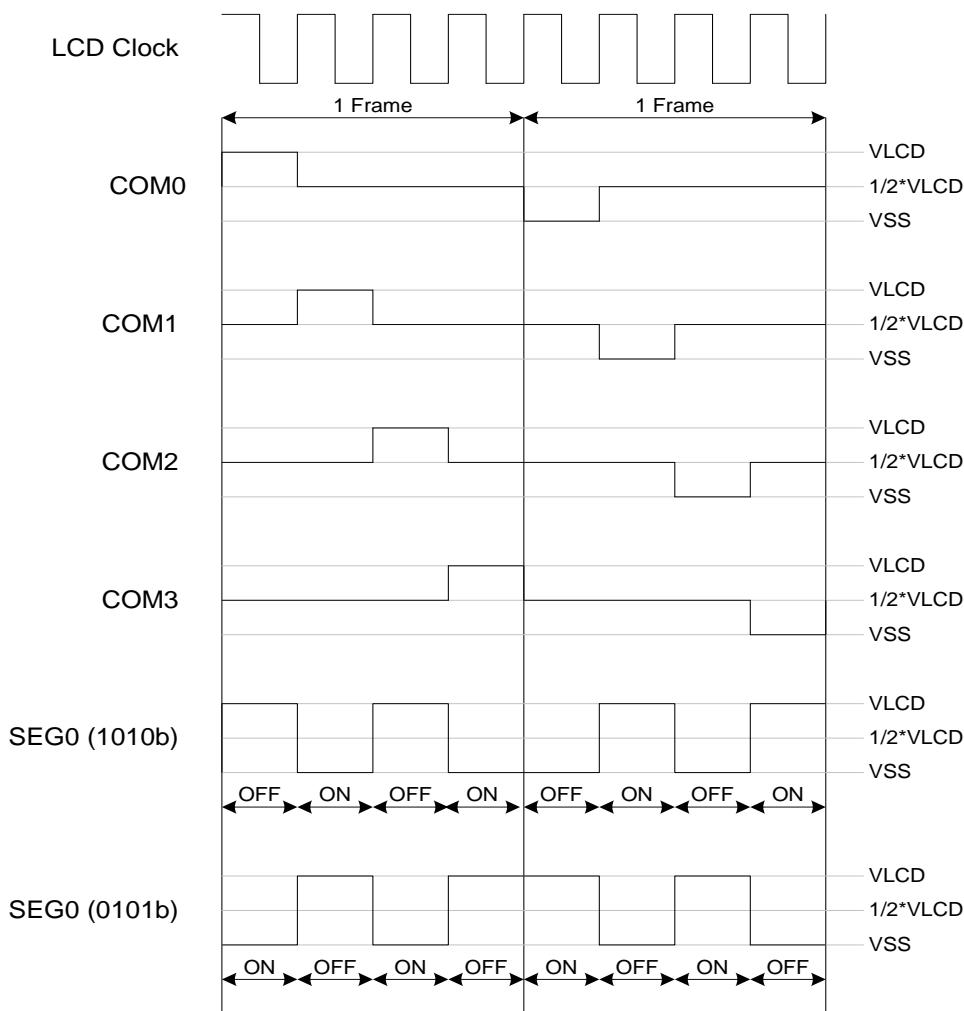

## 9.1 LCD TIMING

BGM set "0", The C-Type LCD drive will auto into Low Power mode when system into Green or Slow Mode with stop high clock (STPHX=1).

Setting LCDPSEL[1:0] for selection of different power saving grades, which can be tuned and test according LCD panel characteristic

LCDPSEL[1:0] set "00" for Small size LCD Panel; LCDPSEL[1:0] set "11" for Larger LCD panel.

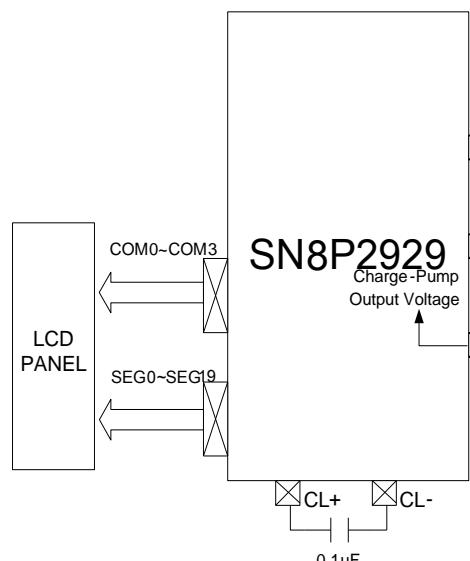

In Low Power Mode, LCD driving Power (\*1) < (\*2) < (\*3) < (\*4)

\*2: the largest drive power in LCD low power mode

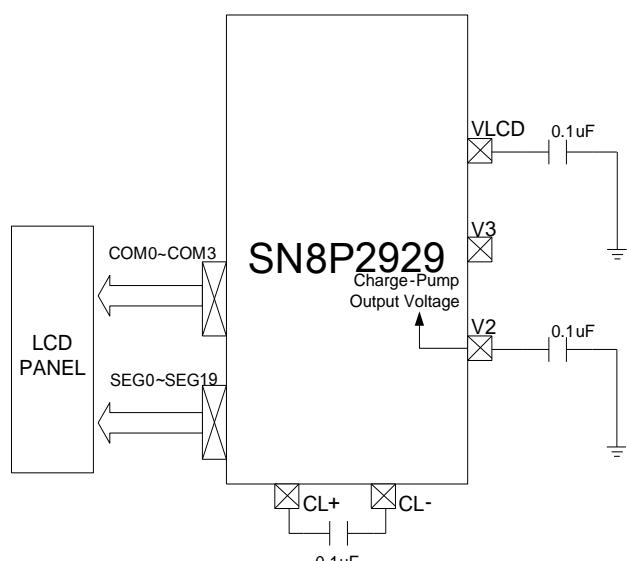

- \* Note\_1: When VCP[3:0]=1111, LCDBIAS=1, LCDTYPE=1 and LCDPENB=1, LCD charge pump is applied to generating VPP voltage for ISP function without additional 6.5V input. Please don't enable LCDENB to protect LCD panel without high voltage present at COM and SEG.
- \* Note\_2: VCP and VPPINTL are controlled for ISP function without external VPP voltage 6.5V. Please reference chapter "IN-System Program ROM".
- \* Note\_3: if VLCD set high voltage output 6.5V for ISP purpose, VLCD/V3/V2 must connect capacitor to DVSS with 0.1uf individually, and CL+/CL- is also connect 0.1uf.
- \* Note\_4: Macro "RomwrtVpp" instruction cover procedures of internal VPP generation and ROMWRT instruction for ISP function without external 6.5V requirement.

## 9.4 C-TYPE LCD DRIVER MODE

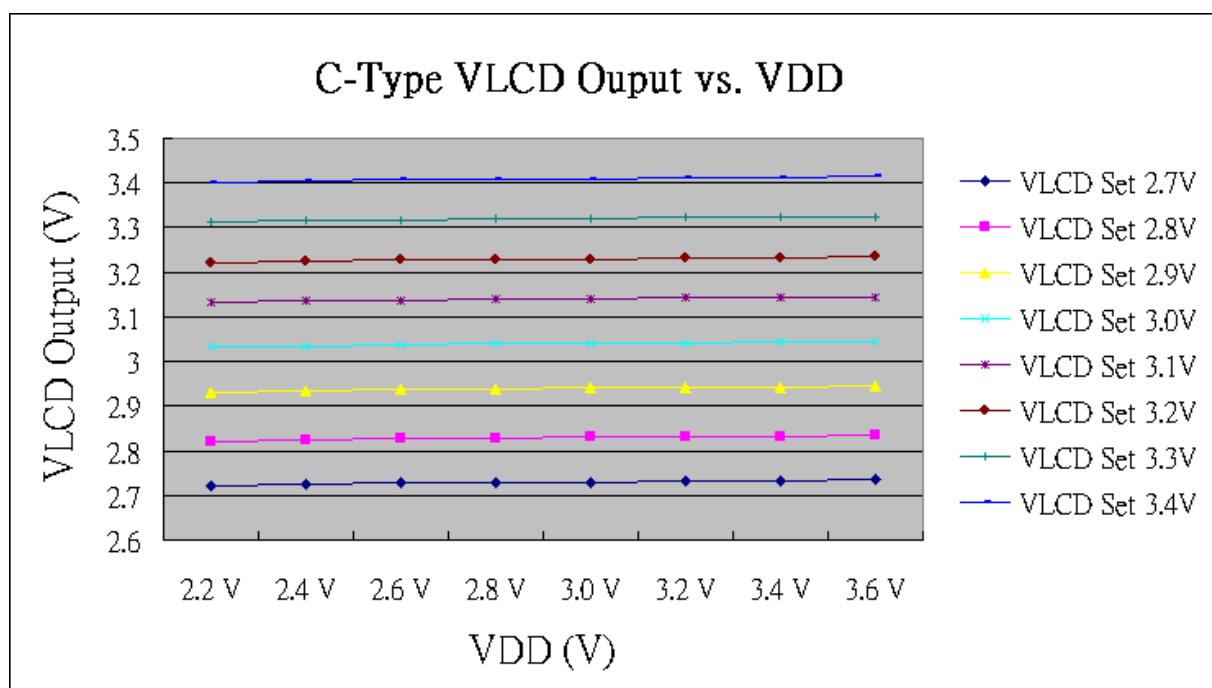

The LCD C-type driver mode is support 1/3 and 1/2 bias LCD panel. The LCD power (VLCD) is supplied by internal LCD charge-pump. The C-Type LCD charge-pump voltage level is following VLCD voltage. V2 is the charge pump source which level is 1/3\*VLCD. V3 is 2 times of V2 by charge pump which level is 2/3\*VLCD. In C-type LCD mode, the LCDTYPE and LCDPENB bit of LCDM1 register must be “1”. The following are shown the 1/3 and 1/2 bias C-Type LCD application circuit and VLCD output voltage chart.

1/3 Basic C-type LCD Application Circuit

1/2 Basic C-type LCD Application Circuit

- \* Note1: In C-Type LCD driver mode, VLCD power is not internal connected to VDD.
- \* Note2 :In C-type mode, connect a 0.1uF capacitor between CL+ and CL- pins. The 0.1uF capacitor also connect pin VLCD/V3/V2 to VSS.
- \* Note3: VLCD output voltage can be set from 2.7V to 3.4V and with  $\pm 0.2V$  accuracy.

- **Example Code:** Enable C-Type LCD function. (Set VLCD = 3.0V, 1/3 bias mode)

**C-Type LCD Setting:**

|                     |             |   |
|---------------------|-------------|---|
| B0BCLR              | FLCDBIAS    | ; Set 1/3 Bias                                |
| B0BCLR              | FVCP3       | ; Set VLCD = 3V                               |
| B0BCLR              | FVCP2       | ; Set VLCD = 3V                               |
| B0BSET              | FVCP1       | ; Set VLCD = 3V                               |
| B0BSET              | FVCP0       | ; Set VLCD = 3V                               |
| B0BSET              | FBGM        | ; Must Set BGM=1.                             |
| B0BSET              | FLCDTYPE    | ; C-Type LCD.                                 |
| B0BSET              | FLCDPENB    | ; CP Enable.                                  |
| <b>LcdPumpStart</b> |             |   |
| B0BSET              | FLCDENB     | ; C-Type pump startup Macro, Must execute it. |
| Call                | Set_LCD_RAM | ; use Macro " <b>LcdPumpStart</b> "           |
| ....                |             |   |

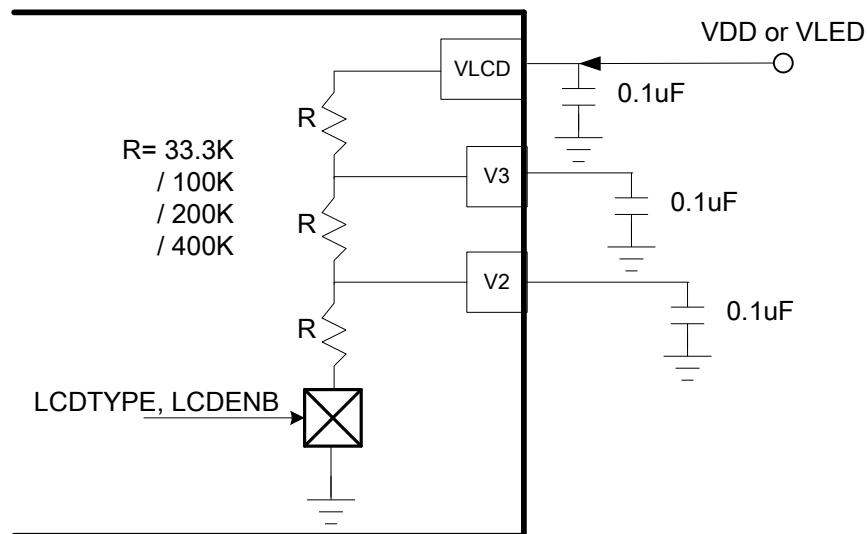

- \* **Note\_1:** The Procedure to execute C-Type LCD driver mode is setting BGM=LCDTYPE=LCDPENB=1, Bias , and VCP[3:0] first, and then must use Macro “**LcdPumpStart**“ to execute and check pump startup .
- \* **Note\_2:** Before use Macro “**LcdPumpStart**”, please include 2929\_Macro.h file first.

## 9.5 R-TYPE LCD DRIVER MODE

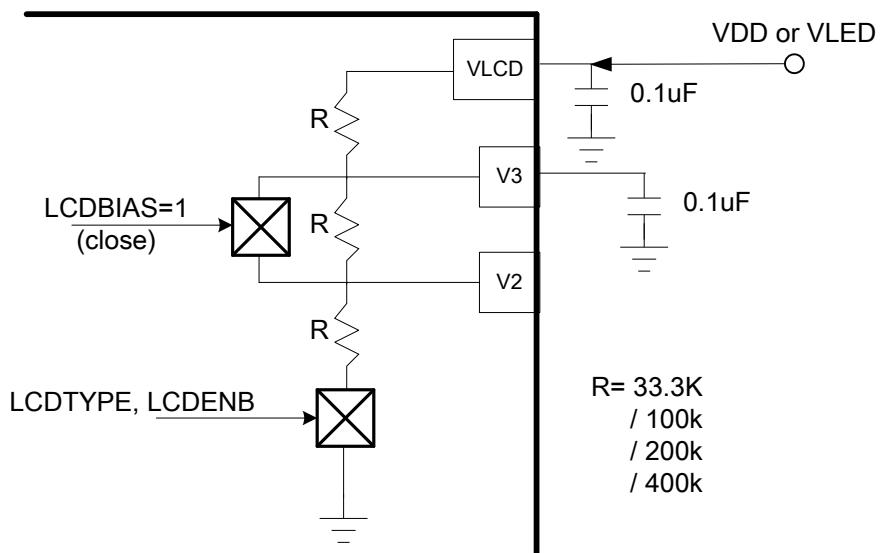

LCD power (VLCD) is source from external power via VLCD pad, not internal short to VDD. In LCD R-type driver, V3 and V2 bias voltage is sourced by internal resistor voltage division. LCD driver electric circuit builds in selective 33.3k, 100k, 200k, 400k of resistor for internal voltage-division. User can connect additional external resistance between VLCD / V3 / V2 for more driving current.

### 1/4 duty with 1/3 bias:

Note:  $V3 = 2/3 * VLCD$ ,  $V2 = 1/3 * VLCD$ . LCD current consumption =  $\frac{VLCD}{3R}$

### 1/4 duty with 1/2 bias:

Note:  $V3 = V2 = 1/2 * VLCD$ . LCD current consumption =  $\frac{VLCD}{2R}$

\* Note: In R-Type LCD driver mode, VLCD pin must input voltage power for LCD circuit operation.

## 9.6 LCD RAM LOCATION

RAM bank 15's address vs. Common/Segment pin location

|        | Bit0  | Bit1  | Bit2  | Bit3  | Bit4 | Bit5 | Bit6 | Bit7 |
|--------|-------|-------|-------|-------|------|------|------|------|
|        | COM0  | COM1  | COM2  | COM3  | -    | -    | -    | -    |
| SEG 0  | 00H.0 | 00H.1 | 00H.2 | 00H.3 | -    | -    | -    | -    |
| SEG 1  | 01H.0 | 01H.1 | 01H.2 | 01H.3 | -    | -    | -    | -    |

| -      | -     | -     | -     | -     | -    | -    | -    | -    |
| SEG 19 | 13H.0 | 13H.1 | 13H.2 | 13H.3 | -    | -    | -    | -    |

- Example: Enable R-Type LCD function.

Set the LCD control bit (LCDENB) and program LCD RAM to display LCD panel.

### R-Type LCD Setting:

|        |             |                                    |
|--------|-------------|------------------------------------|
| B0BCLR | FLCDTYPE    | ; R-Type LCD.                      |
| B0BCLR | FLCDPENB    | ; CP disable.                      |
| B0BSET | FLCDENB     | ; Enable LCD driver.               |
| Call   | Set_LCD_RAM | ; Set LCD RAM to display LCD panel |

# 10 IN SYSTEM PROGRAM ROM

## 10.1 OVERVIEW

In-System-Program ROM (ISP ROM), provided user an easy way to storage data into Read-Only-Memory. Choice any ROM address and executing ROM programming instruction – ROMWRT and supply 6.5V voltage on VPP pin, after programming time which controlled by ROMCNT, ROMDAH/ROMDAL data will be programmed into address ROMADRH/ROMADRL.

## 10.2 ROMADRH/ROMADRL REGISTER

| 0A0H           | Bit 7  | Bit 6 | Bit 5 | Bit 4    | Bit 3    | Bit 2    | Bit 1   | Bit 0   |
|----------------|--------|-------|-------|----------|----------|----------|---------|---------|
| <b>ROMADRH</b> | VPPCHK | -     | -     | ROMADR12 | ROMADR11 | ROMADR10 | ROMADR9 | ROMADR8 |
| Read/Write     | R      | -     | -     | R/W      | R/W      | R/W      | R/W     | R/W     |

| 1 or 0.5 MIP | 10           | 60us             |
| 1 or 0.5 MIP | 11           | 30us             |

When all setting was done, execute **ROMWRT** instruction to program data ROMDA[15:0] into address ROMADR[12:0]

- \* Note1: Please Keep VDD=3V when accessing ISP ROM.
- \* Note2: After access ROMWRT, at least 3 NOP instruction delay is necessary.
- \* Note3: Please executing ISP function in room temperature(25°C)
- \* Note4: Using Macro “RomwrtVpp” to execute ISP function without external VPP 6.5V input. VPP high voltage is generated from IC internally. In this condition, CL+-/VLCD/V3/V2 must connect 0.1uf capacitor individually.
- \* Note5: Interrupt Function must be disabled before ISP execution.

## 10.5 ISP ROM ROUTINE EXAMPLE

- Example : ISP Example with External VPP 6.5V input:

```

# 11 Regulator, PGIA and ADC

## 11.1 OVERVIEW

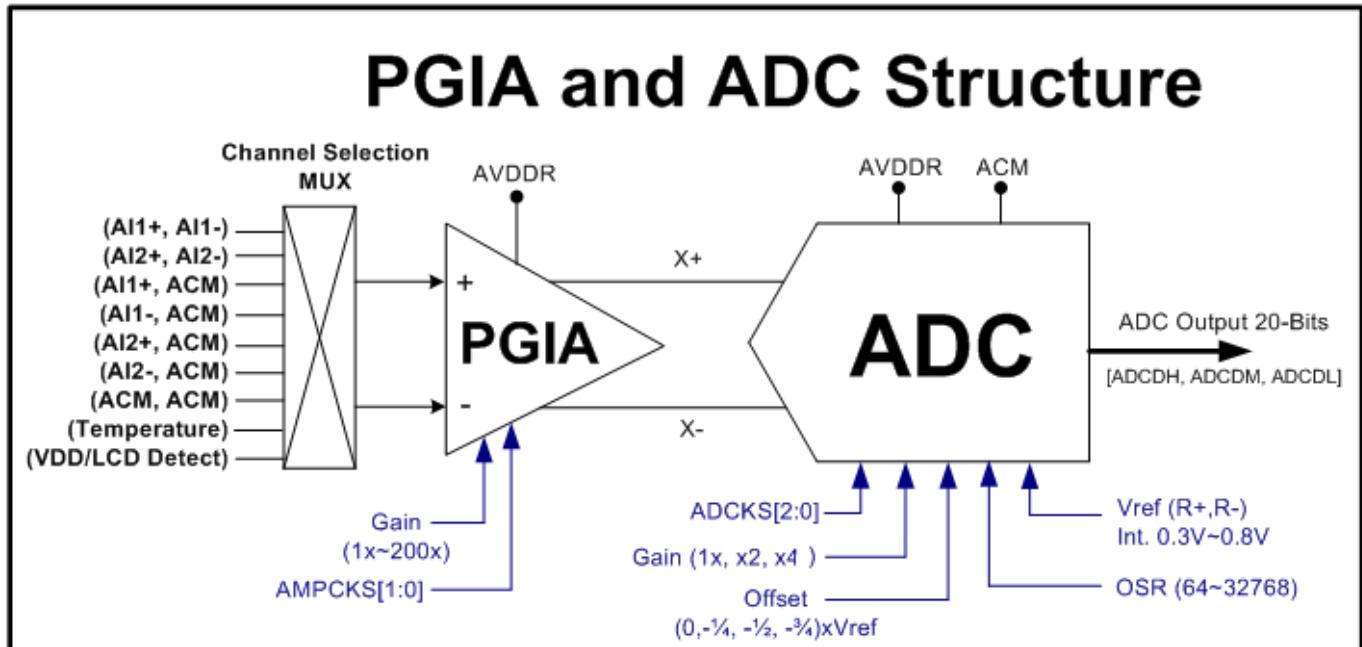

The SN8P2929 has a built-in Voltage Regulator to support a stable voltage 2.4V from pin AVDDR and 1.5V/2.0V from pin AVE+ with maximum 5mA current driving capacity. The AVDDR provides stable voltage for internal circuits (PGIA, ADC) and external sensor (load cell or thermistor). The SN8P2929 series also integrate  $\Delta \Sigma$  Analog-to-Digital Converters (ADC) which output 20-bit with 18-bit accuracy. In fast ADC conversion mode, ADC conversion rate can up to 3.9kHz with 12.4 bit resolution (Gain=1, Vref=0.8V). The ADC has internal Gain option with selective range of x1, x2, and x4. The PGIA provides 2 types of input channel modes: (1) Two fully differential inputs [AI1+, AI1-] and [AI2+, AI2-].

(2) Four single-ended inputs. This ADC is optimized for measuring low-level unipolar or bipolar signals in weight scale and medical applications. A very low noise chopper-stabilized programmable gain instrumentation amplifier (PGIA) with selectable gains of 1x, 12.5x, 50x, 100x and 200x in the ADC to accommodate these applications.

## 11.2 ANALOG INPUT

Following diagram illustrates a block diagram of the PGIA and ADC module. The front end consists of a multiplexer for input channel selection, a PGIA (Programmable Gain Instrumentation Amplifier), and the  $\Delta \Sigma$  ADC modulator.

To obtain maximum range of ADC output, the ADC maximum input signal voltage should be close to but can't over the reference voltage  $V(R+, R-)$ . Choosing a suitable reference voltage and a suitable gain of PGIA can reach this purpose. The relative control bits are RVS and IRVS bits (Reference Voltage Selection) in ADCM1 register and GS[2:0] bits (Gain Selection) in AMPM1 register.

Block Diagram of ADC module

## 11.3 Voltage Regulator

SN8P2929 is built in voltage regulators, which can provide a stable 2.4V (pin AVDDR) and 1.5V/2.0V (pin AVE+) with maximum 5mA current driving capacity. Register VREG can enable or disable AVDDR, AVE+ and ACM output voltage. Because the power of PGIA and ADC are came from AVDDR, turn on AVDDR (AVDDRENB = 1) first before enabling PGIA and ADC. The AVDDR voltage was regulated from VDD.

### 11.3.1 Voltage Regulator Control Register

| 090H        | Bit 7  | Bit 6 | Bit 5  | Bit 4  | Bit 3 | Bit 2    | Bit 1    | Bit 0 |
|-------------|--------|-------|--------|--------|-------|----------|----------|-------|
| VREG        | BGRENB | -     | ACMENB | AVESEL | AVENB | AVDDRSEL | AVDDRENB | -     |
| R/W         | R/W    | -     | R/W    | R/W    | R/W   | R/W      | R/W      | -     |
| After Reset | 0      | -     | 0      | 1      | 0     | 1        | 0        | -     |

Bit1: **AVDDRENB:** Regulator (AVDDR) voltage enable control bit.

- 0 = Disable AVDDR regulator output voltage.
- 1 = Enable AVDDR regulator output voltage

Bit2: **AVDDRSEL:** AVDDR voltage selection control bit.

- 0 = Reserved.
- 1 = AVDDR output 2.4V

Bit3: **AVENB:** AVE+ voltage output control bit.

- 0 = Disable AVE+ output Voltage
- 1 = Enable AVE+ output Voltage

Bit4: **AVESEL:** AVE+ voltage selection control bit.

- 0 = AVE+ output 1.5V
- 1 = AVE+ output 2.0V

Bit5: **ACMENB:** Analog Common Mode (ACM) voltage Enable control bit.

- 0 = Disable Analog Common Mode voltage
- 1 = Enable Analog Common Mode voltage

Bit7: **BGRENB:** Band Gap Reference voltage enable control bit

- 0 = Disable Band Gap Reference Voltage
- 1 = Enable Band Gap Reference Voltage

\* **Note\_1:** Band Gap Reference voltage must be enable (FBRGENB), before following function accessing:  
(Reference AMPM1 and AMPM2 register for detail information)

- (1) Regulators of AVDDR, AVE+ and ACM. (2).PGIA Function.
- (3) Low Battery Detection Function.

\* **Note\_2:** PGIA can work in Normal, Slow or Green Mode, when high clock is still running (STPHX=0).

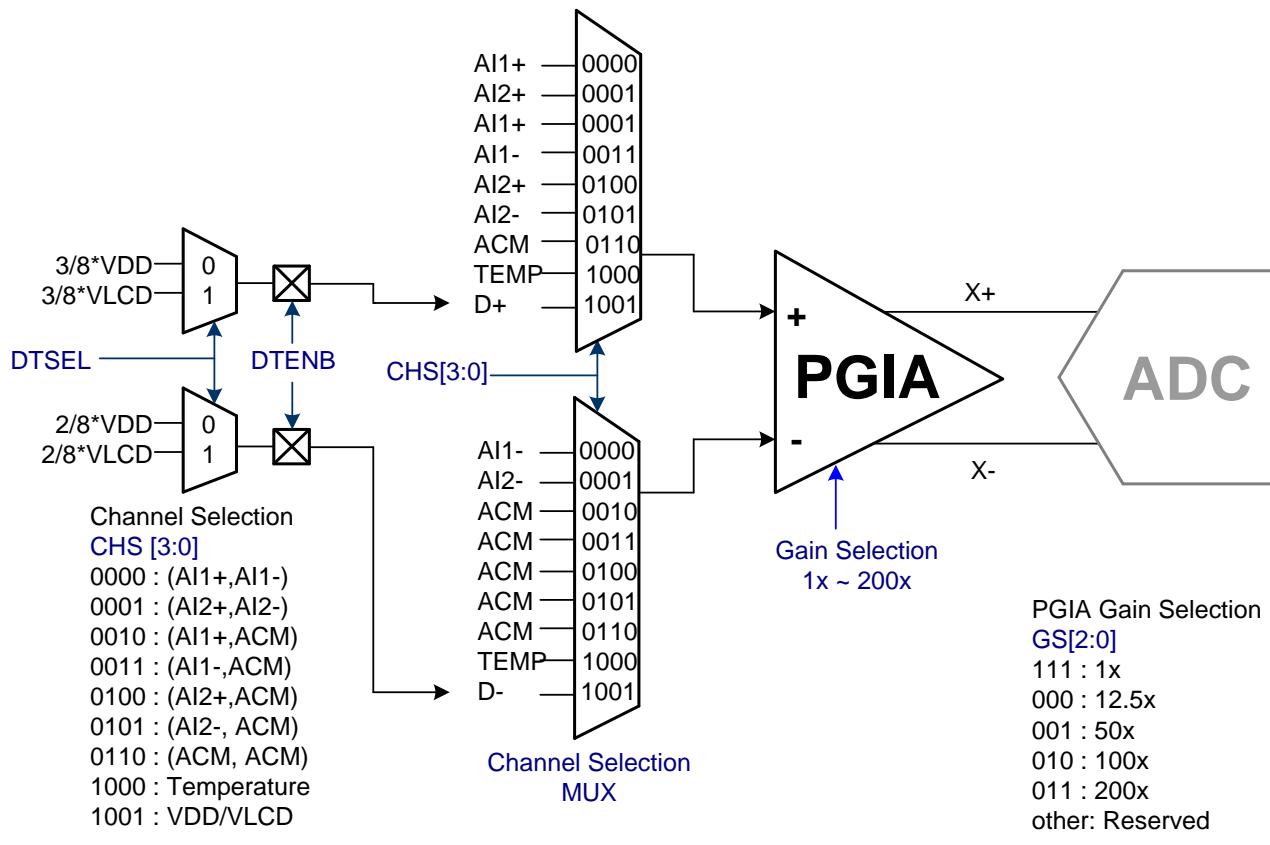

\* **Note\_3:** Add 10ms delay time after enabling each regulators, AVDDR/AVE/ACM, to avoid VDD drop in CR2032 battery application.

| SYM.               | DESCRIPTION                    | PARAMETER                             | MIN. | TYP. | MAX.        | UNIT |

|                    |                                | VACM = 1.5V, @25°C, Vdd = 2.4 ~ 3.6V. | 1.35 | 1.5  | 1.65        |      |
| V <sub>ACM</sub>   | Analog common voltage          | VACM = 0.6V, @25°C, Vdd = 2.4 ~ 3.7V. | 0.9  | 1.0  | 1.1         |      |

## 11.4 PGIA -Programmable Gain Instrumentation Amplifier

SN8P2929 includes a low noise chopper-stabilized programmable gain instrumentation amplifier (PGIA) with selection gains of 1x, 12.5x, 50x, 100x, and 200x controlled by register AMPM1. The PGIA also provides two types channel selection mode: (1) Two fully differential inputs (2) four single-ended inputs; it was defined by register AMPM1.

### PGIA Input Channel Selection and Structure

#### 11.4.1 AMPM1- Amplifier Mode1 Control Register

| 091H         | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0  |
|--------------|-------|-------|-------|-------|-------|-------|-------|--------|
| <b>AMPM1</b> | CHS3  | CHS2  | CHS1  | CHS0  | GS2   | GS1   | GS0   | AMPENB |
| R/W          | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W    |
| After Reset  | 0     | 0     | 0     | 0     | 1     | 1     | 1     | 0      |

Bit0: **AMPENB:** PGIA function enable control bit.  
0 = Disable PGIA function.  
1 = Enable PGIA function.

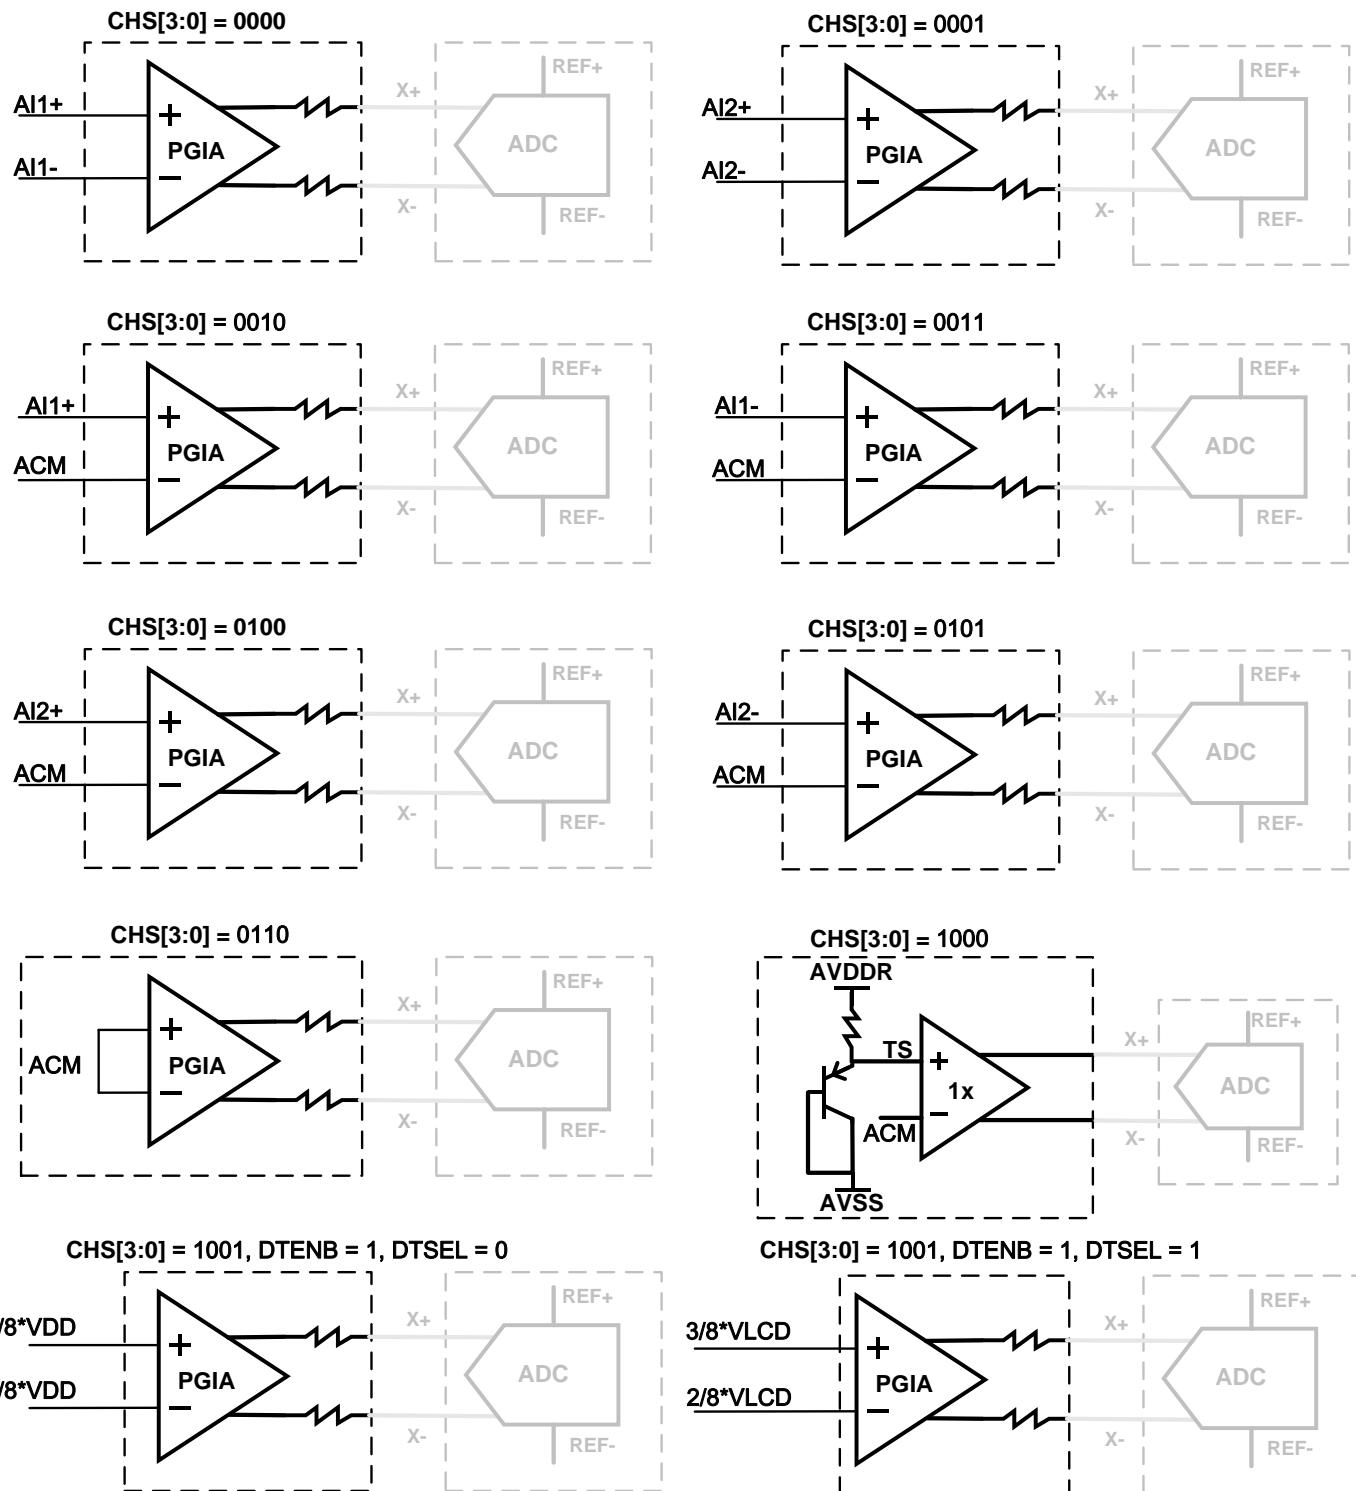

Bit[3:1]: **GS [2:0]:** PGIA Gain Selection control bit.

| GS [2:0] | PGIA Gain              |
|----------|------------------------|
| 000      | 12.5                   |
| 001      | 50                     |
| 010      | 100                    |
| 011      | 200                    |
| 100      | <b>Buffer Function</b> |
| 101,110  | By Pass                |
| 111      |                        |

Bit[7:4]: **CHS [3:0]**: PGIA Channel Selection.

**PGIA Channel Selection Table:**

| CHS [3:0] | Selected Channel   | ADC Input   | Input-Signal Type |
|-----------|--------------------|---|-------------------|
| 0000      | AI1+, AI1-         | V (AI1+, AI1-) × PGIA Gain  | Differential      |
| 0001      | AI2+, AI2-         | V (AI2+, AI2-) × PGIA Gain  | Differential      |
| 0010      | AI1+, ACM          | V (AI1+, ACM) × PGIA Gain   | Single-ended      |
| 0011      | AI1-, ACM          | V (AI1-, ACM) × PGIA Gain   | Single-ended      |
| 0100      | AI2+, ACM          | V (AI2+, ACM) × PGIA Gain   | Single-ended      |
| 0101      | AI2-, ACM          | V (AI2-, ACM) × PGIA Gain   | Single-ended      |
| 0110      | ACM, ACM           | V (ACM, ACM) × PGIA Gain  | Input-Short       |
| 0111      | Reserved           | -   | -                 |
| 1000      | Temperature sensor | V (VTS, ACM) × 1  | N/A               |
| 1001      | Voltage Detection  | VDD (2/8VDD, 3/8VDD) × PGIA Gain<br>VLCD (2/8VLCD, 3/8VLCD) × PGIA Gain | Differential      |

- \* Note\_1:  $V(AI1+, AI1-) = (AI1+ voltage - AI1- voltage)$ .
- \* Note\_2:  $V(AI2+, ACM) = (AI2+ voltage - ACM voltage)$ .
- \* Note\_3: The purpose of Input-Short mode is only for PGIA offset testing.
- \* Note\_4: When PGIA Gain set 1x (GS[2:0]=111) application, the AI+/AI- signal will bypass PGIA and input ADC directly. PGIA can be disabled (AMPENB=0) for power saving, and input buffer of **ADC must be enabled (GX=1)** for input high impedance characteristic of ADC.
- \* Note\_5: When Input buffer enable (GX=1 or GR=1), the input absolutely voltage range of signal must within **0.4V~1.4V**.

### 11.4.2 AMPM2- Amplifier Mode2 Control Register

| 092H        | Bit 7  | Bit 6 | Bit 5 | Bit 4   | Bit 3   | Bit 2   | Bit 1 | Bit 0 |
|-------------|--------|-------|-------|---------|---------|---------|-------|-------|
| AMPM2       | INRENB | GX    | GR    | AMPCKS1 | AMPCKS0 | PCHPENB | DTENB | DTSEL |
| R/W         | R/W    | R/W   | R/W   | R/W     | R/W     | R/W     | R/W   | R/W   |
| After Reset | 1      | 0     | 0     | 1       | 0       | 1       | 0     | 0     |

Bit0: **DTSEL**: VDD/VLCD voltage Detect function control bit.

- 0 = Select VDD Voltage Detect function
- 1 = Select VLCD Voltage Detect function

Bit1: **DTENB**: VDD/VLCD voltage Detect function Enable bit.

- 0 = Disable VDD/VLCD Voltage Detect function
- 1 = Enable VDD/VLCD Voltage Detect function

Bit2: **PCHPENB**: PGIA Chopper Enable bit. (**Always set “1”**)

- 0 = Disable PGIA Chopper
- 1 = Enable PGIA Chopper.

Bit[4:3]: **AMPCKS[1:0]**: PGIA chopper frequency selection. (**Always set AMPCKS[1:0] = 10**)

Bit5: **GR**: R+ R+ Unit Gain Buffer Function control bit.

- 0 = Disable R+ R- UGB function. (When ADC Vref set from internal)
- 1 = Enable R+ R- UGB function. (When ADC Vref set from external pin R+ and R-.)

Bit6: **GX**: X+ X+ Unit Gain Buffer Function control bit.

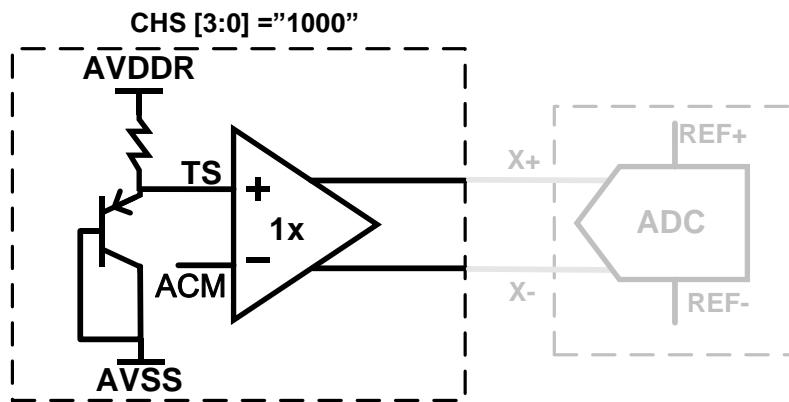

- 0 = Disable X+ X- UGB function. (When PGIA Gain set x12.5, x50, x100, or x200)
- 1 = Enable X+ X- UGB function. (When PGIA Gain set x1)

Bit7: **INRENB**: (**Always set “1”**)

- \* **Note\_1:** In general application, please set AMPCKS[1:0] = 10.
- \* **Note\_2:** Set INRENB = 1 for increasing EMS characteristic.
- \* **Note\_3:** When Input buffer enable (GX=1 or GR=1), the input absolutely voltage range of signal must within 0.4V~1.4V.

## 11.5 Temperature Sensor (TS)

In applications, sensor characteristic might change in different temperature also. To get the temperature information, SN8P2929 build in a temperature sensor (TS) for temperature measurement. Select the respective PGIA channel to access the Temperature Sensor ADC output.

- \* Note 1: When selected Temperature Sensor, PGIA gain must set to 1x, or the result will be incorrect.
- \* Note 2: Under this setting, X+ will be the V(TS) voltage, and X- will be ACM.
- \* Note 3: The Temperature Sensor was just a reference data not real air temperature. For precision application, please use external thermistor sensor.

In 25°C, V(TS) will be about 1V typically, and if temperature rise 10°C, V(TS) will increase about 32mV ( $V_{Ts} = 1.032V$ ), if temperature drop 10°C, V(TS) will increase about 32mV ( $V_{Ts} = 0.968V$ ).

### Example:

| Temperature | V(TS)  | (X+) – (X-) | ADC Vref | ADC output (16-Bit) |
|-------------|--------|-------------|----------|---------------------|
| 15°C        | 0.968V | -0.032V     | 0.6V     | -1747               |
| 25°C        | 1.000V | 0V          | 0.6V     | 0                   |
| 35°C        | 1.032V | 0.032V      | 0.6V     | 1747                |

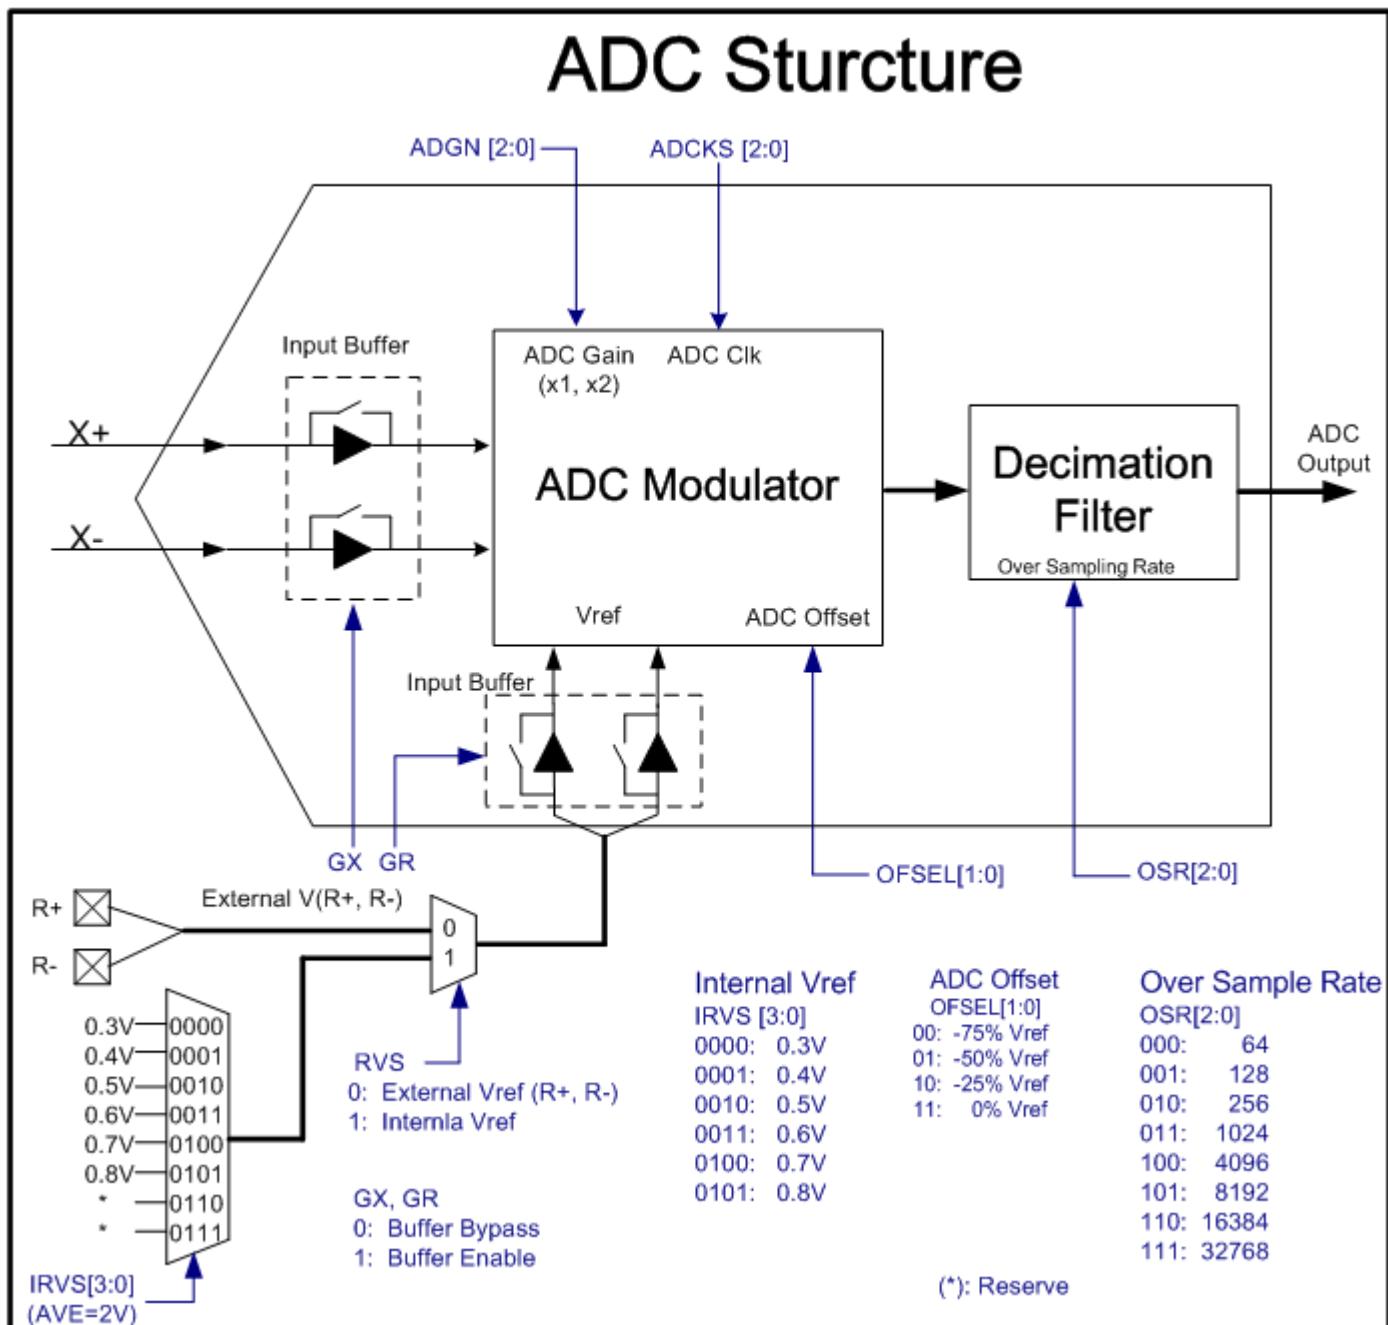

By ADC output of V(TS), can get temperature information and compensation the system.

- \* Note 1: The V(TS) voltage and temperature curve of each chip might different. Calibration in room temperature is necessary when application temperature sensor.
- \* Note 2: 3.23mV/°C was typical temperature parameter only sensor, every single chip was different to each other.

| SYM. | DESCRIPTION                    | PARAMETER                               | MIN. | TYP. | MAX. | UNIT  |

## 11.6 20-Bit Analog to Digital Converter (ADC)

The SN8P2929 integrated a 20-bit  $\Delta\Sigma$  Analog-to-Digital Converters (ADC) with decimation filters can be set for variable throughputs range from 1Hz up to 3.9 kHz. A reference voltage (Vref) is built in internal with selective range from 0.3V to 0.8V in AVE=2V condition, or an external reference voltage can be used to adjust an adequate range via differential voltage between input pins of R+ and R-. The on-chip input buffers can be used to provide high input impedance for direct connection to sensitive transducers. The ADC builds in internal Gain Option with selective range of x1, x2, and x4 for additional signal amplification expect PGIA.

|               |               |                  |
|---------------|---------------|------------------|
| Internal Vref | ADC Offset    | Over Sample Rate |

( \* ): Reserve

### 11.6.1 Analog Inputs and Voltage Operation Range

There are six analog inputs for ADC and PGIA operation, including pins of AI1+/AI1-, AI2+/AI2-, R+, and R-. The analog inputs of PGIA, AI1+/AI1-, AI2+/AI2-, are connected to external sensor's output signal, which can be configured as differential mode (AI+ to AI-) or single-end (AI± to ACM). External Vref for ADC is decided by differential voltage of input pin R+ and R-. All of analog inputs are restricted in absolute voltage range between 0.4V to 1.4V. Moreover, the output signals of PGIA, X+/X-, must also remain within the absolute voltage range.

### 11.6.2 Reference Voltage

There are two reference voltage (Vref) sources option for ADC operation. One is from internal Vref another is from external Vref. The ADC's Vref is selected using **RVS** and **IRVS[3:0]** bits in register **ADCM1**. When **RVS** bit is set to '1', the ADC uses a internal Vref source which can be selected value from 0.3V~0.8 with 0.1V step via setting **IRVS[3:0]** bits. When **RVS** bit is cleared to '0', the Vref is from external and the value is decided by differential voltage between Pins of **R+** and **R-**. Detail setting reference register **ADCM1**.

### 11.6.3 Input Buffer

Input Buffers are included ADC signal input buffer and ADC external reference input buffer R+/R-, which provide a high impedance of analog input, to minimized the input current of ADC for sensitive measurement and to avoid loading effect. When PGIA set 1x of application, the sensor output signal is bypass PGIA and direct connected to ADC's input. In that case, Input buffer function must be enabled by setting GX bit as "1". If external Vref is selected for ADC, input buffer R+/R- also must be enabled by setting GR bit as "1".

### 11.6.4 ADC Gain and Offset

The ADC builds in internal Gain Option with selective range of x1, x2 and x4 for additional signal amplification expect PGIA. The ADC Gain setting is controlled by **ADGN [1:0]** bits in register **ADCM1**. The analog signal after ADC Gain amplification, it can be adjusted offset level by subtraction or addition function, to increase the signal operation range of ADC in weigh-scales application. ADC Offset function is controlled by **OFSEL [1:0]** bits in register **ADCM2**. The following shows ADC output code calculation:

**ADC output code (differential mode) :**

$$\text{16bits: } \frac{[(AI+) - (AI-)] \times PGIA \times ADC\_Gain + V_{Offset}}{V_{ref}} \times 2^{(16-1)} = +32767 \sim -32768$$

$$\text{18bits: } \frac{[(AI+) - (AI-)] \times PGIA \times ADC\_Gain + V_{Offset}}{V_{ref}} \times 2^{(18-1)} = +131071 \sim -131072$$

$$\text{20bits: } \frac{[(AI+) - (AI-)] \times PGIA \times ADC\_Gain + V_{Offset}}{V_{ref}} \times 2^{(20-1)} = +524287 \sim -524288$$

**Voffset:** 0, -1/4, -1/2 or -3/4 x Vref

**PGIA:** 1x ~ 200x

**ADC\_Gain:** 1x , 2x, and 4x

**Vref Source:** Internal Vref or External Vref

**Vref Range:** 0.3V ~ 0.8V

- \* **Note\_1:** When ADC Offset Function set -1/4\*Vref, the ADC ENOB will drop 0.1~0.3bit, compare with ADC no offset function in Gain=200\*1
- \* **Note\_2:** When ADC Offset Function set -1/2\*Vref, the ADC ENOB will drop 0.3~0.5 bit, compare with ADC no offset function in Gain=200\*1
- \* **Note\_3:** When ADC Offset Function set -3/4\*Vref, the ADC ENOB will drop 0.6~0.8 bit, compare with ADC no offset function in Gain=200\*1

### 11.6.5 ADC Output Word Rate

Delta-Sigma ADC provides variable output word rate (WR) from 0.95 Hz up to 3.9 kHz, which output word rate is decided by setting bits of **ADCKS[2:0]** and **OSR [2:0]**. The ADC output code with slow output word rate is more stable than fast one. In ADC's application, that should be tradeoff between ADC's output word rate and stability (ENOB). The following table shows the ADC output word rate with setting:

**ADC Output Word Rate Table:**

| ADCKS[2:0] | OSR [2:0] | ADC Clock | WR       | ADCKS[2:0] | OSR [2:0] | ADC Clock | WR      |
|------------|-----------|-----------|----------|------------|-----------|-----------|---------|
| 000        | 000       | 250KHz    | 3.9 kHz  | 001        | 000       | 125kHz    | 1.95KHz |
| 000        | 001       |           | 1.95 kHz | 001        | 001       |           | 976Hz   |
| 000        | 010       |           | 976 Hz   | 001        | 010       |           | 488Hz   |
| 000        | 011       |           | 244 Hz   | 001        | 011       |           | 122Hz   |
| 000        | 100       |           | 61 Hz    | 001        | 100       |           | 30.5Hz  |
| 000        | 101       |           | 30.5 Hz  | 001        | 101       |           | 15.2Hz  |
| 000        | 110       |           | 15.2 Hz  | 001        | 110       |           | 7.6Hz   |
| 000        | 111       |           | 7.6 Hz   | 001        | 111       |           | 3.8Hz   |
| ADCKS[2:0] | OSR [2:0] | ADC Clock | WR       | ADCKS[2:0] | OSR [2:0] | ADC Clock | WR      |
| 010        | 000       | 62.5kHz   | 976Hz    | 011        | 000       | 31.25kHz  | 488Hz   |
| 010        | 001       |           | 488Hz    | 011        | 001       |           | 244Hz   |
| 010        | 010       |           | 244Hz    | 011        | 010       |           | 122Hz   |
| 010        | 011       |           | 61Hz     | 011        | 011       |           | 30.5Hz  |
| 010        | 100       |           | 15.2Hz   | 011        | 100       |           | 7.6Hz   |
| 010        | 101       |           | 7.6Hz    | 011        | 101       |           | 3.8Hz   |
| 010        | 110       |           | 3.8Hz    | 011        | 110       |           | 1.9Hz   |
| 010        | 111       |           | 1.9Hz    | 011        | 111       |           | 0.95Hz  |

### 11.6.6 ADCM1- ADC Mode1 Register

| 093H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0  |
|-------------|-------|-------|-------|-------|-------|-------|-------|--------|
| ADCM1       | RVS   | IRVS3 | IRVS2 | IRVS1 | IRVS0 | ADGN1 | ADGN0 | ADCENB |
| R/W         | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W    |
| After Reset | 1     | 0     | 1     | 0     | 1     | 0     | 0     | 0      |

Bit0: **ADCENB**: ADC function control bit:

- 0 = Disable 20-bit ADC,
- 1 = Enable 20-bit ADC

Bit[2:1]: **ADGN[1:0]**: ADC Gain Selection

| ADGN[1:0] | ADC Gain |
|-----------|----------|
| 00        | x1       |
| 01        | x2       |
| 10        | x4       |

Bit[6:3]: **IRVS[3:0]**: ADC Internal Reference Voltage Selection.

| IRVS[3:0] | Vref source |          |
|-----------|-------------|----------|
|           | AVE 1.5V    | AVE 2.0V |
| 0000      | 0.225V      | 0.3V     |
| 0001      | 0.300V      | 0.4V     |
| 0010      | 0.375V      | 0.5V     |
| 0011      | 0.450V      | 0.6V     |
| 0100      | 0.525V      | 0.7V     |
| 0101      | 0.600V      | 0.8V     |
| 0110~1111 | Reserved    | Reserved |

Bit7: **RVS:** ADC Reference Voltage Internal/External Selection bit.  
 0 = Selection ADC Reference voltage from **External** reference R+, R-.  
 1 = Selection ADC Reference voltage from **Internal** reference with AVE or AVDDR.

- \* **Note\_1:** the Operation range of ADC Reference Voltage (Vref) is from 0.3V to 0.8V.
- \* **Note\_2:** Vref(Int.) means ADC reference voltage form internal setting; Vref(Ext.) means ADC reference voltage from external (R+ and R- input).

### 11.6.7 ADCM2- ADC Mode2 Register

| 094H               | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2  | Bit 1  | Bit 0 |
|--------------------|-------|-------|-------|-------|-------|--------|--------|-------|
| <b>ADCM2</b>       | -     | OSR2  | OSR1  | OSR0  | -     | OFSEL1 | OFSEL0 | DRDY  |
| <b>R/W</b>         | -     | R/W   | R/W   | R/W   | -     | R/W    | R/W    | R/W   |
| <b>After Reset</b> | -     | 1     | 1     | 1     | -     | 1      | 1      | 0     |

Bit0: **DRDY:** ADC Conversion Ready bit:  
 1 = ADC output (update) new conversion data to ADCDH, ADCDM, and ADCDL.  
 0 = ADCDH, ADCDM, and ADCDL conversion data are not ready.

Bit[3:1] **OFSEL[1:0]:** ADC Offset selection.

| OFSEL[1:0] | Offset %  |
|------------|-----------|
| 00         | -75% Vref |
| 01         | -50% Vref |
| 10         | -25% Vref |
| 11         | 0% Vref   |

Bit[6:4] **OSR [2:0]:** ADC OSR Selection.

| OSR [2:0] | OSR   |
|-----------|-------|
| 000       | 64    |
| 001       | 128   |
| 010       | 256   |
| 011       | 1024  |
| 100       | 4096  |
| 101       | 8192  |
| 110       | 16384 |
| 111       | 32768 |

### 11.6.8 ADCM3- ADC Mode3 Register

| 095H               | Bit 7 | Bit 6 | Bit 5 | Bit 4   | Bit 3   | Bit 2  | Bit 1  | Bit 0  |
|--------------------|-------|-------|-------|---------|---------|--------|--------|--------|
| <b>ADCM3</b>       | -     | -     | -     | ACHPENB | ADCKINV | ADCKS2 | ADCKS1 | ADCKS0 |
| <b>R/W</b>         | -     | -     | -     | R/W     | R/W     | R/W    | R/W    | R/W    |
| <b>After Reset</b> | -     | -     | -     | 1       | 0       | 0      | 0      | 0      |

Bit[2:0]: **ADCKS[2:0]:** ADC Clock selection bit.

| ADCKS[2:0] | ADC Clock |
|------------|-----------|
| 000        | 250kHz    |
| 001        | 125KHz    |
| 010        | 62.5KHz   |
| 011        | 31.25KHz  |
| 1xx        | Reserved  |

Bit[3]: ADCKINV: ADC Clock Inverse control bit. (**Please Always set “0”**)

Bit[4]: ACHPENB: ADC Chopper Control bit. (**Please Always set “1”**)

- \* Note 1 ADC Output Word Rate (WR) = ADC Clock / OSR.
- \* Note 2: Adjust ADC clock (ADCKS[2:0]) and OSR can get suitable ADC output word rate.
- \* Note 3: For High resolution application, OSR set maximum value of 32768 recommended.
- \* Note 4: Clear Bit DRDY after got ADC data or this bit will keep high all the time.
- \* Note 5: ADC output stable data at the 3<sup>rd</sup> data after ADC enable. The 3<sup>rd</sup>, 4<sup>th</sup>, 5<sup>th</sup> ... are stable data after 1/WR later of each.

**11.6.9 ADC Data Register**

| 097H        | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |

| R/W         | R      | R      | R      | R      | R      | R      | R     | R     |
| After Reset | 0      | 0      | 0      | 0      | 0      | 0      | 0     | 0     |

| 099H        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| ADCDL       | ADCB7 | ADCB6 | ADCB5 | ADCB4 | ADCB3 | ADCB2 | ADCB1 | ADCB0 |
| R/W         | R     | R     | R     | R     | R     | R     | R     | R     |
| After Reset | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

ADCDH[7:0]: Output high byte data of ADC conversion word.

ADCDM[7:0]: Output medium byte data of ADC conversion word.

ADCDL [7:0]: Output low byte data of ADC conversion word.

| <i>ADC conversion data<br/>(2's compliment, Hexadecimal)</i> | <i>Decimal Value</i> |
|--|----------------------|
| 0x7FFFFH   | 524287               |
| ...  | ...                  |
| 0x40000H   | 262144               |
| ...  | ...                  |
| 0x10000H   | 65536                |
| ...  | ...                  |
| 0x00002H   | 2                    |
| 0x00001H   | 1                    |
| 0x00000H   | 0                    |
| 0xFFFFFH   | -1                   |
| 0xFFFFEH   | -2                   |
| ...  | ...                  |
| 0xF0000H   | -65536               |
| ...  | ...                  |
| 0xC0000H   | -262144              |
| ...  | ...                  |
| 0x80000H   | -524288              |

- \* Note 1: ADCDH [7:0], ADCDM [7:0] and ADCDL [7:0] are read only registers.
- \* Note 2: For 16-Bit ADC resolution, please use registers of ADCDH and ADCDM (ADCB23~ADCB08).  
For 18-Bit ADC resolution, please use registers of ADCDH, ADCDM and ADCDL.  
(ADCB23~ADCB06).
- For 20-Bit ADC resolution, please use registers of ADCDH, ADCDM and ADCDL.  
(ADCB23~ADCB04).
- For 24-Bit ADC resolution, please use registers of ADCDH, ADCDM and ADCDL.  
(ADCB23~ADCB00)
- \* Note 3: The ADC conversion data is combined with ADCDH, ADCDM, ADCDL in 2's compliment with sign bit numerical format, and Bit ADCB23 is the sign bit of ADC data.  
ADCB23=0 means data is Positive value, ADCB23=1 means data is Negative value.
- \* Note 4: The Positive Full-Scale-Output value of ADC conversion is 0x7FFF.
- \* Note 5: The Negative Full-Scale-Output value of ADC conversion is 0x80000H.
- \* Note 6: Because of the ADC design limitation, the ADC Linear range is +131071 ~ -131072 (18-bit).  
(+0.9\*Vref ~ - 0.9\*Vref). The MAX ADC output must keep inside this range.

Following table shows the Noise and ENOB (RMS and peak-to-peak) of the SN8P2929 ADC with different output word rate and gain settings. These numbers are typical and generated using a differential input-short condition, and with 1024-data of measurement.

| 2929 ADC Performance ENOB (Noise Free Bit) vs. Output WR and Gain |                      |         |        |        |         |         |         |        |
|---|----------------------|---------|--------|--------|---------|---------|---------|--------|
| Gain  | ADC Output Word Rate |         |        |        |         |         |         |        |
|   | 3.9 kHz              | 2.0 kHz | 977 Hz | 244 Hz | 61.0 Hz | 30.5 Hz | 15.3 Hz | 7.6 Hz |
| 1 x 1*  | 12.21                | 12.92   | 13.83  | 16.00  | 16.92   | 17.54   | 18.19   | 18.54  |
| 1 x 2*  | 12.06                | 12.86   | 13.54  | 15.36  | 16.38   | 17.16   | 17.37   | 17.75  |
| 12.5 x 1  | 12.02                | 12.85   | 13.54  | 14.75  | 16.15   | 16.50   | 16.94   | 17.52  |
| 50 x 1  | 11.89                | 12.30   | 13.42  | 14.45  | 15.61   | 16.09   | 16.42   | 17.09  |
| 100 x 1   | 11.70                | 12.00   | 12.68  | 13.83  | 14.91   | 15.42   | 15.79   | 16.60  |
| 100 x 2   | 10.96                | 11.19   | 11.83  | 12.94  | 13.87   | 14.43   | 15.16   | 15.37  |
| 200 x 1   | 11.02                | 11.64   | 11.91  | 12.91  | 14.02   | 14.53   | 15.18   | 15.46  |

\*: Buffer off (GX=0, GR=0)

All Test condition: ADC 250kHz, Input-Short, Vref=0.8V, Gain = PGIA x ADC, Collect 1024 ADC date.

- (1). Noise Free Resolution = Log2 (Full Scale Range / Peak-Peak Noise)  
where Full Scale Range = 2 x Vref / Gain (ex. Vref=0.8V, Gain=200x)
- (2). Effective Resolution = Log2 (Full Scale Range / RMS\_Noise)
- (3). RMS Noise =  $\sigma$  x LSB\_Resolution  
where LSB\_Resolution = Full Scale Range / 2^Bit, Bit=20  
 $\sigma$  = standard deviation of 1024 ADC output data.
- (4). Peak-Peak Noise = 6.6 x RMS Noise, or code variation range x LSB\_Resolution  
Where Code variation range = ADC counts max-min of 1024 data.

| 2949 ADC Peak to Peak Noise(uV) vs. Output WR and Gain |                      |         |         |        |         |         |         |        |
|--|----------------------|---------|---------|--------|---------|---------|---------|--------|

- \* Note 1: Please set ADC relative registers first before enable ADC function.
- \* Note 2: Before enable ADC function, please set analog function (regulators, PGIA and ADC) and wait 500us for all functions stable.
- \* Note 3: In fast ADC conversion application, the third ADC data will available for application.
- \* Note 4: The second ADC will available after ADC channel switched and in condition of ADC not disable status.
- \* Note 5: For increasing fast ADC conversion accuracy, recommend averaging several times of ADC row Data for application.

## 11.7 LBTM: Low Battery Detect

SN8P2929 provided two different ways to measure VDD Voltage. One is from ADC reference voltage selection. It will be more precise but take more time and a little bit complex. Another way is using build in Voltage Comparator via internal or external input path to detect VDD voltage level. There are eight internal levels, every 0.1V one level from 2.2V~2.9V. The Function can be set for low battery detect, or via divide VDD voltage and connect to P52. Bit LBTO will output for indication of LBT status.

### 11.7.1 LBTM: Low Battery Detect Register

| 095H        | Bit 7 | Bit 6    | Bit 5    | Bit 4   | Bit 3   | Bit 2   | Bit 1 | Bit 0  |
|-------------|-------|----------|----------|---------|---------|---------|-------|--------|
| <b>LBTM</b> | -     | P51IO    | LBTSEL3  | LBTSEL2 | LBTSEL1 | LBTSEL0 | LBTO  | LBTENB |
| R/W         | -     | R/W      | R/W      | R/W     | R/W     | R/W     | R     | R/W    |
| After Reset | -     | <b>0</b> | <b>0</b> | 0       | 1       | 0       | 0     | 0      |

Bit0      **LBTENB:** Low Battery Detect mode control Bit.

0 = Disable Low Battery Detect function,  
1 = Enable Low Battery Detect function

Bit1:      **LBTO:** Low Battery Detect Output Bit.

0 = LBT voltage (VLBT) Higher than Band Gap Reference Voltage 1.2V.  
1 = LBT voltage (VLBT) Lower than Band Gap Reference Voltage 1.2V.

Bit[5:2]:      **LBTSEL[3:0]:** Low Battery Detect threshold voltage selection bit.

| LBTENB | LBTSEL [3:0] | LBTO = 1           | Note                 |
|--------|--------------|--------------------|----------------------|
| 0      | -            | -                  | LBT Function disable |
| 1      | 0000         | VDD < 2.2V         | Internal Input       |
| 1      | 0001         | VDD < 2.3V         | Internal Input       |
| 1      | 0010         | VDD < 2.4V         | Internal Input       |
| 1      | 0011         | VDD < 2.5V         | Internal Input       |
| 1      | 0100         | VDD < 2.6V         | Internal Input       |
| 1      | 0101         | VDD < 2.7V         | Internal Input       |
| 1      | 0110         | VDD < 2.8V         | Internal Input       |
| 1      | 0111         | VDD < 2.9V         | Internal Input       |
| 1      | 1xxx         | P52 < 1.2V, LBTO=1 | External Input       |

Bit6:      **P51IO:** Port 5.1 Input/LBT function control bit.

0 = Set P51 as Input Port,  
1 = Set P51 as LBT function, P51 connect to ground internally.

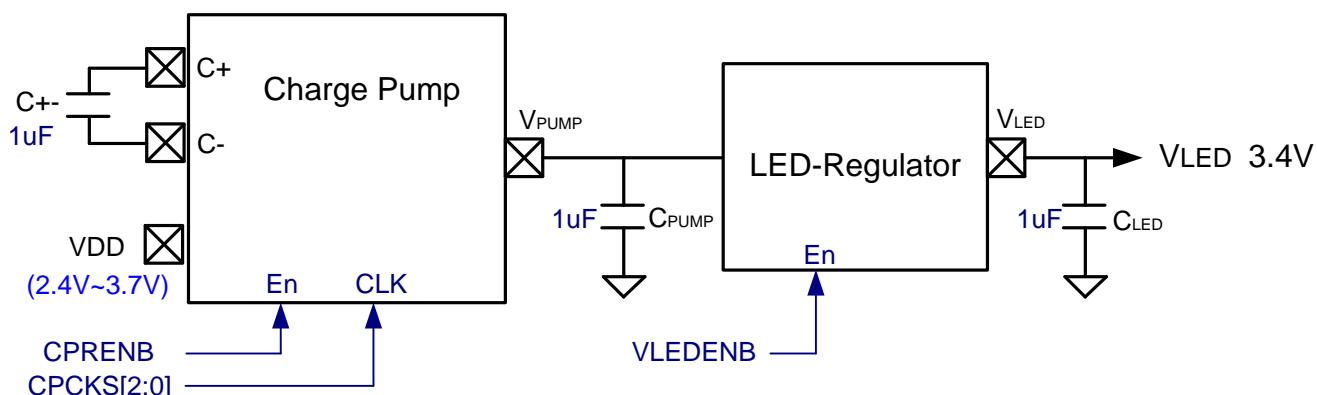

External Input (P52) LBT functions:

| Low Battery Voltage | R1    | R2    | LBTO=1   |
|---------------------|-------|-------|----------|
| 2.3V                | 470kΩ | 530kΩ | VDD<2.3V |
| 2.8V                | 620kΩ | 470kΩ | VDD<2.8V |

- \* Note\_1: Get LBTO = 1 more 10 times in a raw every certain period, ex. 20 ms or more to make sure the Low Battery signal is stable.
- \* Note\_2: LBT external input P52 and P51IO function is available in ICE emulation.
- \* Note\_3: IO input voltage must keep lower than VDD.

## 11.8 Charge Pump and LED Regulator

SN8P2929 provided fixed Regulator output voltage, which is for LED driving purpose. LED-Regulator output voltage is 3.5V from VDD 3.6V to 2.4V. Its maximum driving current is over 8mA when DVDD is 2.4V. The diagram below shows the charge pump and LED Regular system.

- Charge Pump output voltage  $V_{PUMP} = 2 \times VDD$ , VDD range from 2.4V~3.7V
- Capacitors requirement:  $C_{PUMP} = C_{C-} = C_{LED} = 1\mu F$
- LED-Regulator output voltage 3.5V.
- LED-Regulator maximum driving current is 8mA at VDD = 2.4V.

**CPM register initial value = xxx0 0000**

| 09AH        | Bit 7 | Bit 6 | Bit 5 | Bit 4   | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|-------------|-------|-------|-------|---------|--------|--------|--------|--------|
| LEDCPM      | -     | -     | -     | VLEDENB | CPCKS2 | CPCKS1 | CPCKS0 | CPRENB |
| R/W         | -     | -     | -     | R/W     | R/W    | R/W    | R/W    | R/W    |
| After Reset | -     | -     | -     | 0       | 0      | 0      | 0      | 0      |

Bit0      **CPRENB:** LED Charge Pump Enable bit for VLED power source.  
0 = Disable charge pump.  
1 = Enable charge pump.

Bit[3:1]    **CPCKS[2:0]:** Charge Pump Clock Selection Bits.

| CPCKS[2:0] | Charge pump clock |
|------------|-------------------|
| 0xx        | Reserved          |
| 100        | 15.625 KHz        |
| 101        | 31.25 KHz         |
| 110        | 62.5 KHz          |
| 111        | 125 KHz           |

Bit3      **LEDENB:** VLED Output 3.5V Enable Bit.  
0 = Disable VLCD output.  
1 = Enable charge pump. Only available in normal mode

- \* Note 1: VLED Start recommendation : Enable CPRENB about 5ms before enable LEDENB
- \* Note 2: Charge Pump LED-Regular function is available in normal mode and slow mode (STPHX = 0).
- \* Note 3: Current consumption from VLED will time 2 when charge pump was enabled.
- \* Note 4: When CPRENB = 0, Vpump = VDD.
- \* Note 5: If VLED output current is over 8mA, it is strongly recommended to select the 125kHz

| SYM. | DESCRIPTION                    | PARAMETER                        | MIN. | TYP. | MAX. | UNIT |
|------|--------------------------------|----------------------------------|------|------|------|------|
| VLED | VLED Output Voltage            | VDD = 3V.                        | 3.2  | 3.4  | 3.6  | V    |
| ILED | VLED Output Current Capacity T | VDD = 2.4V, Pump Clock = 125KHz. | 8    | -    | -    | mA   |

## 11.9 Analog Setting and Application

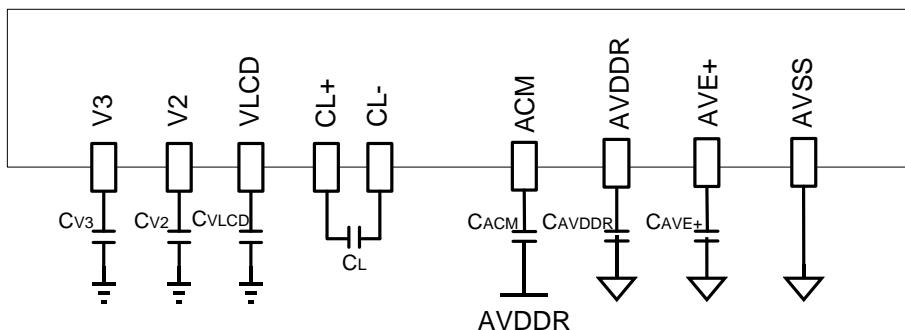

The most applications of SN8P2949 were for DC measurement ex. Weight scale, Pressure measure. Following table indicate different applications setting which MCU power source came from CR2032 battery, AA/AAA dry battery or external Regulator.

**Capacitor Table:**

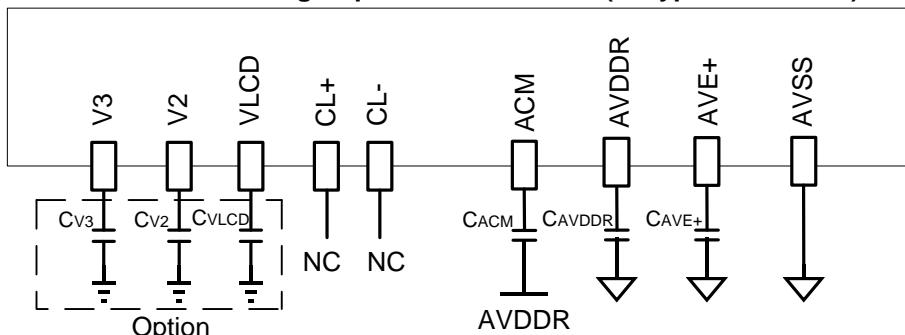

| Power type             | AI+       | AI-       | R+/ R- | ACM       | AVDDR       | AVE+       | CL+/CL- | C+/C- | VPUMP      | VLED      | AVDD           | DVDD           |
|------------------------|-----------|-----------|--------|-----------|-------------|------------|---------|-------|------------|-----------|----------------|----------------|
|                        | $C_{AI+}$ | $C_{AI-}$ | $C_R$  | $C_{ACM}$ | $C_{AVDDR}$ | $C_{AVE+}$ | $C_L$   | $C_C$ | $C_{pump}$ | $C_{LED}$ | $C_{AVDD}$     | $C_{DVDD}$     |
| CR2032 (2.4~3V)        | 0.01uF    | 0.01uF    | 0.1uF  | 0.1uF     | 0.47uF      | 0.47uF     | 0.1uF   | 1uF   | 1uF        | 1uF       | 10uF,<br>0.1uF | 10uF,<br>0.1uF |
| AA/AAA<br>Bat.(2.4~3V) | 0.01uF    | 0.01uF    | 0.1uF  | 0.1uF     | 1uF         | 1uF        | 0.1uF   | 1uF   | 1uF        | 1uF       | 1uF, 0.1uF     | 1uF, 0.1uF     |

- \* Note\_1: In R-Type LCD mode,  $C_L$  is not connected to MCU.
- \* Note\_2: In CR2032 battery application, 0.47uf capacitors are applied to AVE and AVDDR for lower VDD drop when regulator turn on at low battery situation.
- \* Note\_3: If AVE+ and AVDDR connect 0.47uf capacitors, the maximum output current of AVE+ will be limited 3mA maximally.
- \* Note\_4: When MCU VDD power sources from AA/AAA dry battery directly, not via other LDO, 1uF capacitor can be applied to VDD and without VDD drop when regulator turns on at low battery status.

VDD=2.4V ~ 3.6V Analog Capacitor Connection (C-Type LCD Driver)

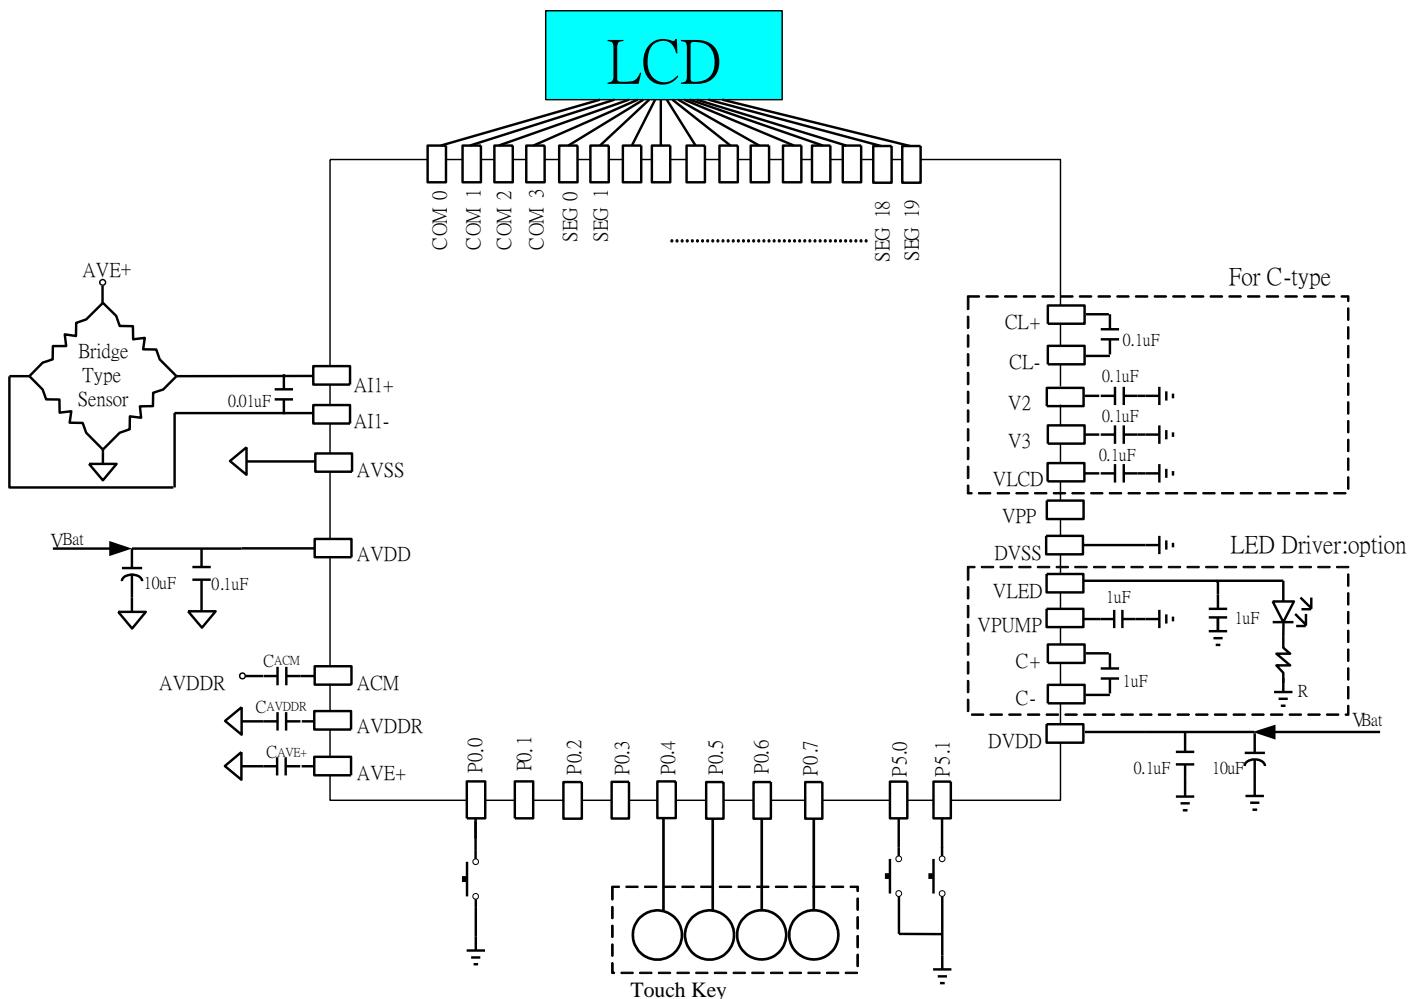

VDD=2.4V ~ 3.6V Analog Capacitor Connection (R-Type LCD Driver)

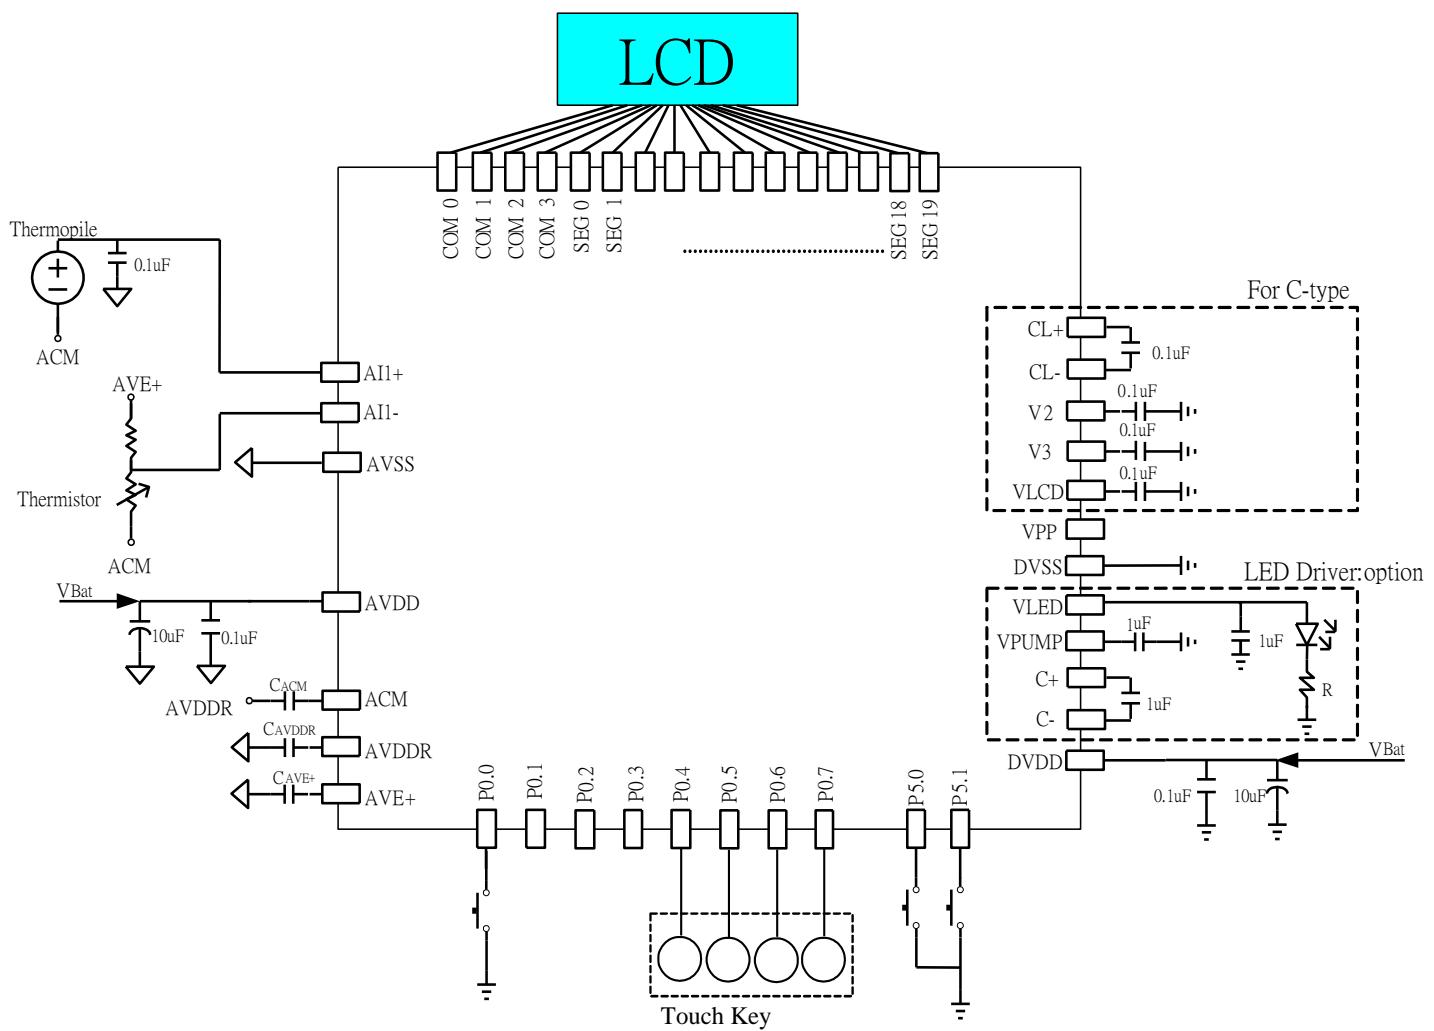

# 12 APPLICATION CIRCUIT

## 12.1 Scale (Load Cell) Application Circuit

\* Note: DVDD/AVDD Capacitors should be as close as possible with pins of IC

## 12.2 Thermometer Application Circuit

\* Note: DVDD/AVDD capacitors should be as close as possible with pins of IC

Note: 1. The "M" is memory including system registers and user defined memory.

2. If branch condition is true then "S = 1", otherwise "S = 0".

3. If "M" is system registers (80h ~ FFh of bank 0) then "N" = 0, otherwise "N" = 1

# 14 Development Tools

## 14.1 Development Tool Version

### 14.1.1 ICE (In circuit emulation)

- SN8ICE2K Plus II: Full function emulates SN8P2929
- \* SN8ICE2K ICE emulation notice
  - Operation voltage of ICE: 3.3V.
  - Recommend maximum emulation speed at 3.3V: 1 MIPS (e.g. Fcpu = Fosc/4).
  - Use SN8P2929 EV-KIT to emulation Analog Function.
  - Note: S8ICE1K doesn't support SN8P2929 emulation.

### 14.1.2 OTP Writer

MP Pro Writer : ON/OFF line operation to support SN8P2929 mass production.

\* Note: MPIII Writer doesn't support SN8P2929 OTP programming.

### 14.1.3 IDE (Integrated Development Environment)

SONiX 8-bit MCU integrated development environment include Assembler, ICE debugger and OTP writer software.

- SN8ICE 2K Plus II
- Easy Writer, MP-Easy and MPIII Writer doesn't support SN8P2929

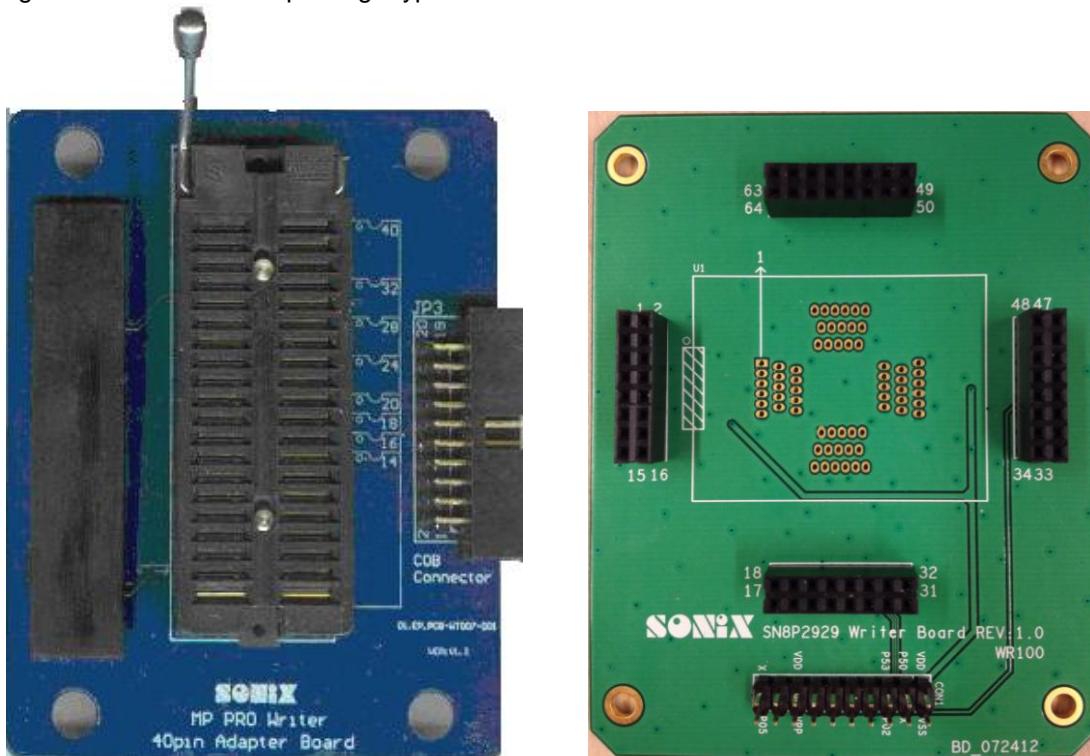

## 14.2 OTP Programming Pin to Transition Board Mapping

### SN8P2929 COB Programming Pin Mapping:

### SN8P2929 Package Type Programming with 40 PIN adapter board and with writer board:

1. 40 PIN adapter board connect to MP PRO Writer.
2. Connect CON1 of SN8P2929 Writer Board to the adapter board (JP3).
3. Program Kit is needed for package type of LQFP-64 IC.

## 14.3 APPENDIX A: EV-KIT BOARD CIRCUIT

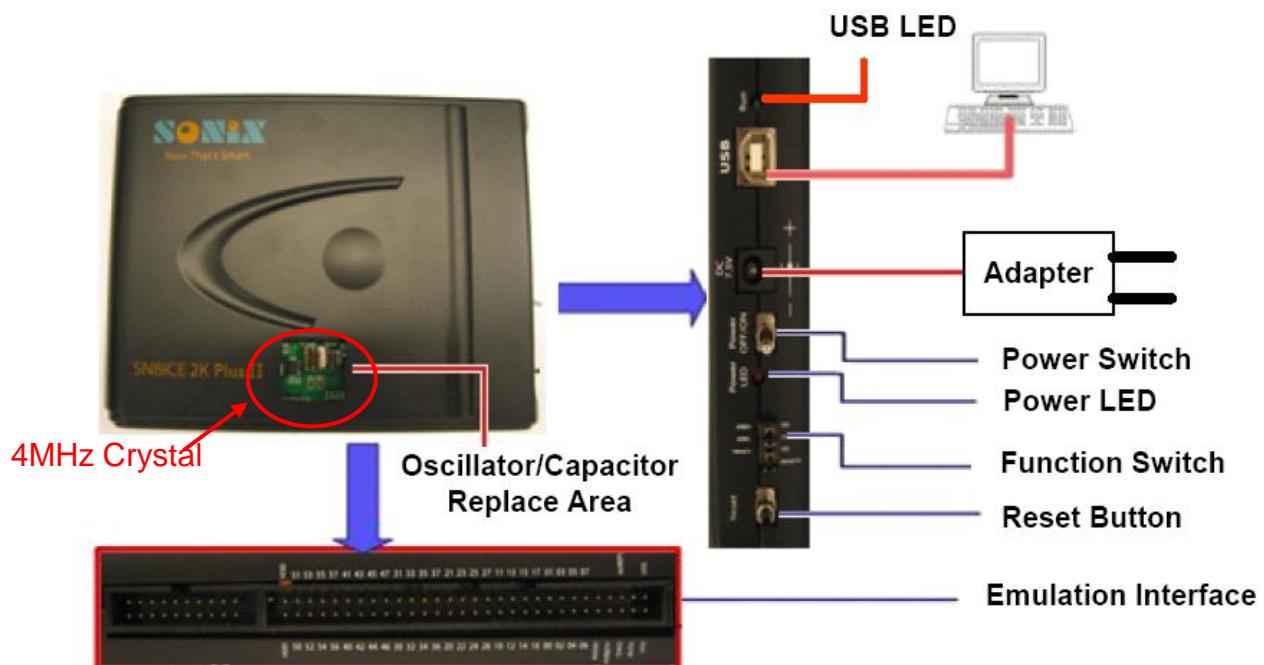

## 14.4 SN8P2929 Emulation

### 14.4.1 INTRODUCTION

Sonix provides a complete EV-KIT for SN8P2929 emulation, which includes an ICE SN8ICE2K\_Plus\_II, a SN8P2929 EV Board, Sonix Assembler and Complier. Users are able to do the programming on the computer and to simulate the program code using the software or the ICE itself. On the other hand, when executing the program and monitoring the RAM status, users can use various functions such as Breakpoint, Single step etc. This makes debug much easier for most programmers.

### 14.4.2 SN8ICE2K\_Plus\_II Hardware Setting Notice for SN2929 EV-Kit

1. Chosen 4MHz crystal connects to ICE for System high clock (Fhosc).
2. Check VDD is shorted to Internal\_3.3V by jumper. VDD is only 3.3V available for SN8P2929 emulation.
3. Detail setting reference [SN8ICE2K Plus II User's Manual](#).

### **14.4.3 SN8P2929 EV-kit Board DESCRIPTION**

Sonix provides SN8P2929 EV board for all functions emulation shown in FIG.1.

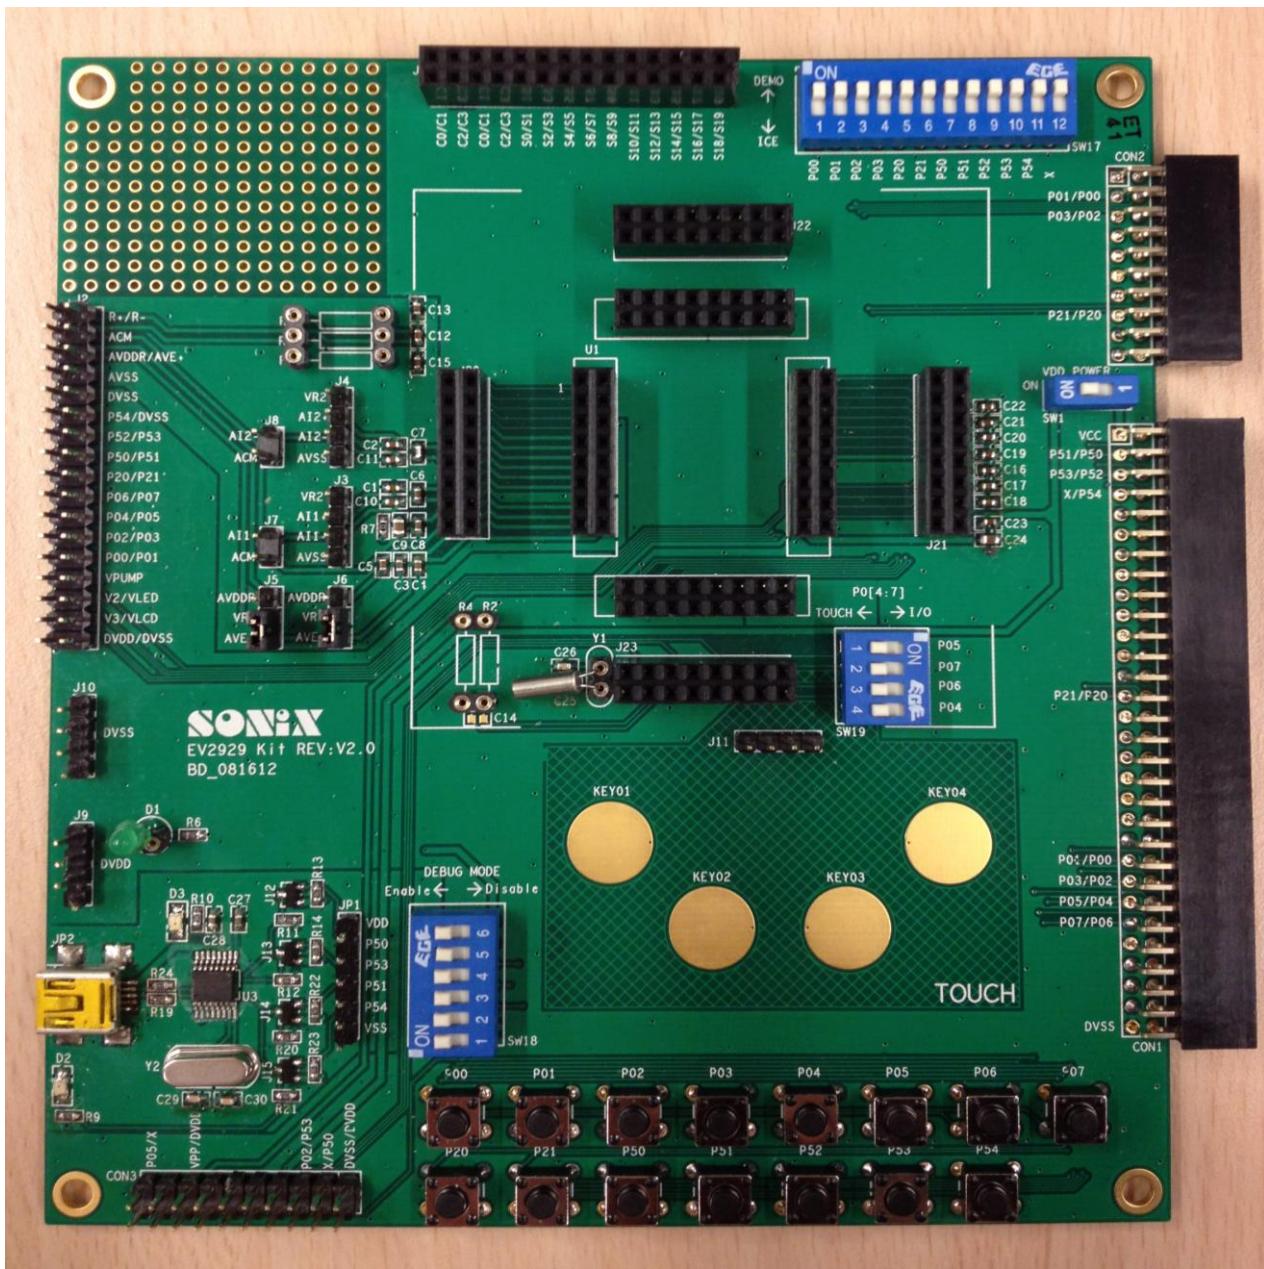

FIG.1 SN8P2929 EV-kit board

#### 14.4.4 EV-kit BOARD SETTING

1. U1/U2 : SN8P2929 LQFP64 Socket
  2. CON1/CON2 : connecting with the ICE PORT
  3. SW1: Switch it “ON” position when EV board using power from ICE (3.3V), and switch it “Off” when EV board using other power source via J2/J3 input.
  4. SW17: Switch to “ICE” position when EV-Board connect to ICE. When separate ICE and EV board, switch to “DEMO” position , or else the relative IO port won’t work.
  5. J1 : LCD COM/SEG connect Pin.
  6. J2: Target board connector.
  7. J3/J4 : Analog Differential (AI1+, AI1-), (AI2+, AI2-) input Pin.

8. J5: Selection of external reference voltage V(R+, R-) power from AVDDR or AVE+.
9. J6 : Selection of Load cell power from AVDDR or AVE+.
10. J7/J8: Analog Single-End (AI1-/ACM), (AI2-/ACM) input Pin.
11. R1/R3/R5: Resistors for ADC external reference voltage.
12. D1 : Power indicator
13. R2/R4 : Resistors for low battery detect. R2 is connected with VDD and LBTIN2. R4 is connected with LBTIN2 and LBTIN1.
14. SW19: Selection “on”: P04~P07 as GPIO function, or select it “Off”: P04~P07 as touch pad function.
15. J11: The pin is used for external touch pad. When it is used, R15~R18 should be opened.
16. SW18: Selection the debug mode for touch function, when switch “on” means enable the debug mode, otherwise disable the debug mode.
17. JP2: When enable the debug mode under touch function, JP2 should be connected to PC by mini USB.

#### 14.4.5 Notice for EV-kit Emulation

1. ICE VDD must switch to 3.3V. VDD 5V is not available for SN8P2929 EV-kit
2. SW17 must switch to “ICE” position.
3. Low Battery Detect (LBT) function can support both internal LBT emulation and external P52 Input.
4. The Level of internal LBT emulation function on the EV-kit Board ranges from 2.2V to 2.9V
5. Before using Internal LBT emulation, SW1 should be open, and the reference voltage is from J9
6. Node LBTIN2 is the external input of LBT. Node LBTIN1 can be I/O or internally grounded determined by setting flag P51IO. Before using external LBT emulation, SW1 should be also open.
7. X command is canceled in ICE emulation. (XB0MOV, XB0BSET...)

# 15 ELECTRICAL CHARACTERISTIC

## 15.1 ABSOLUTE MAXIMUM RATING

|  |                                    |
|--|------------------------------------|
| Supply voltage ( $V_{DD}$ ).....                 | - 0.3V ~ 3.6V                      |
| Input in voltage ( $V_{IN}$ ).....               | $V_{SS} - 0.2V \sim V_{DD} + 0.2V$ |
| Operating ambient temperature ( $T_{OPR}$ )..... | 0°C ~ + 70°C                       |
| Storage ambient temperature ( $T_{STOR}$ ).....  | -40°C ~ + 125°C                    |

## 15.2 ELECTRICAL CHARACTERISTIC

(All of voltages refer to  $V_{SS}$ ,  $V_{DD} = 3.0V$ ,  $F_{HOSC} = IHRC(4MHz)$ ,  $F_{CPU} = 1MHz$ , ambient temperature is 25°C unless otherwise note.)

# 17 Marking Definition

## 17.1 INTRODUCTION

There are many different types in Sonix 8-bit MCU production line. This note listed the production definition of all 8-bit MCU for order or obtains information. This definition is only for Blank OTP MCU.

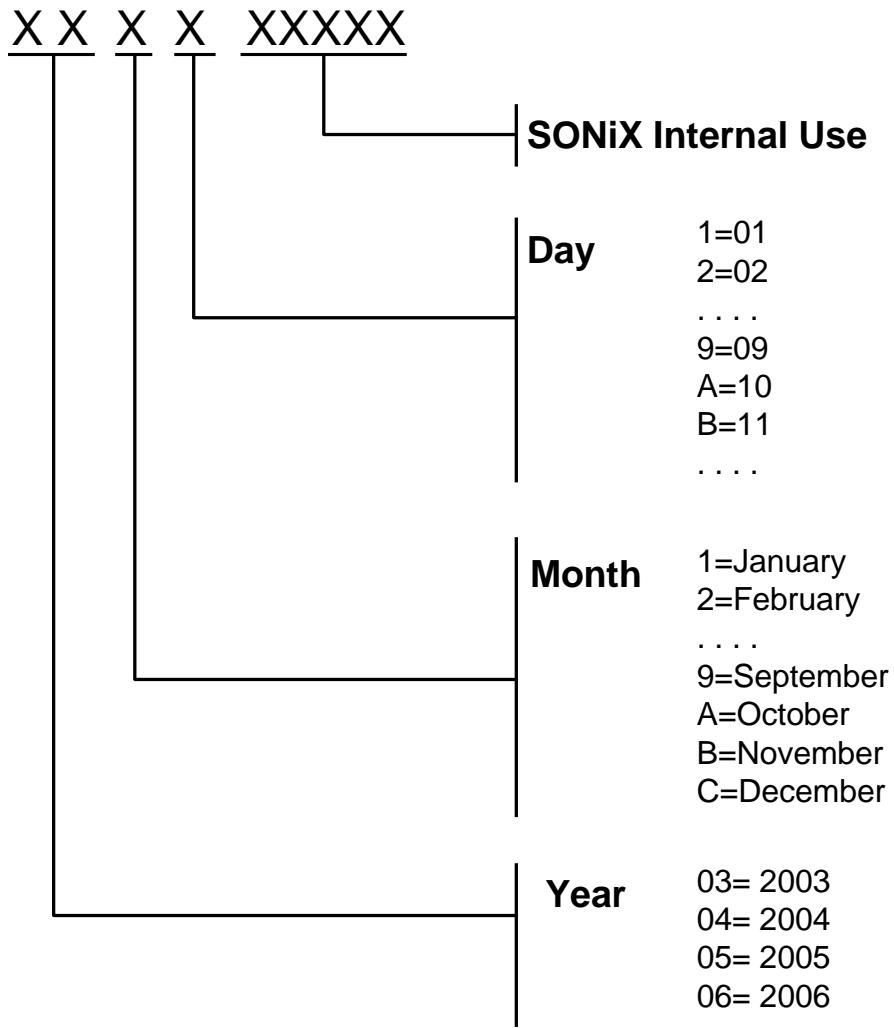

## 17.2 MARKING IDENTIFICATION SYSTEM

## 17.3 MARKING EXAMPLE

| Name       | ROM Type | Device | Package | Temperature | Material      |
|------------|----------|--------|---------|-------------|---------------|
| SN8P2929FG | OTP      | 2929   | LQFP64  | 0°C~70°C    | Green Package |

## 17.4 DATECODE SYSTEM

SONIX reserves the right to make change without further notice to any products herein to improve reliability, function or design. SONIX does not assume any liability arising out of the application or use of any product or circuit described herein; neither does it convey any license under its patent rights nor the rights of others. SONIX products are not designed, intended, or authorized for us as components in systems intended, for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SONIX product could create a situation where personal injury or death may occur. Should Buyer purchase or use SONIX products for any such unintended or unauthorized application. Buyer shall indemnify and hold SONIX and its officers , employees, subsidiaries, affiliates and distributors harmless against all claims, cost, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use even if such claim alleges that SONIX was negligent regarding the design or manufacture of the part.
